# OVERVIEW

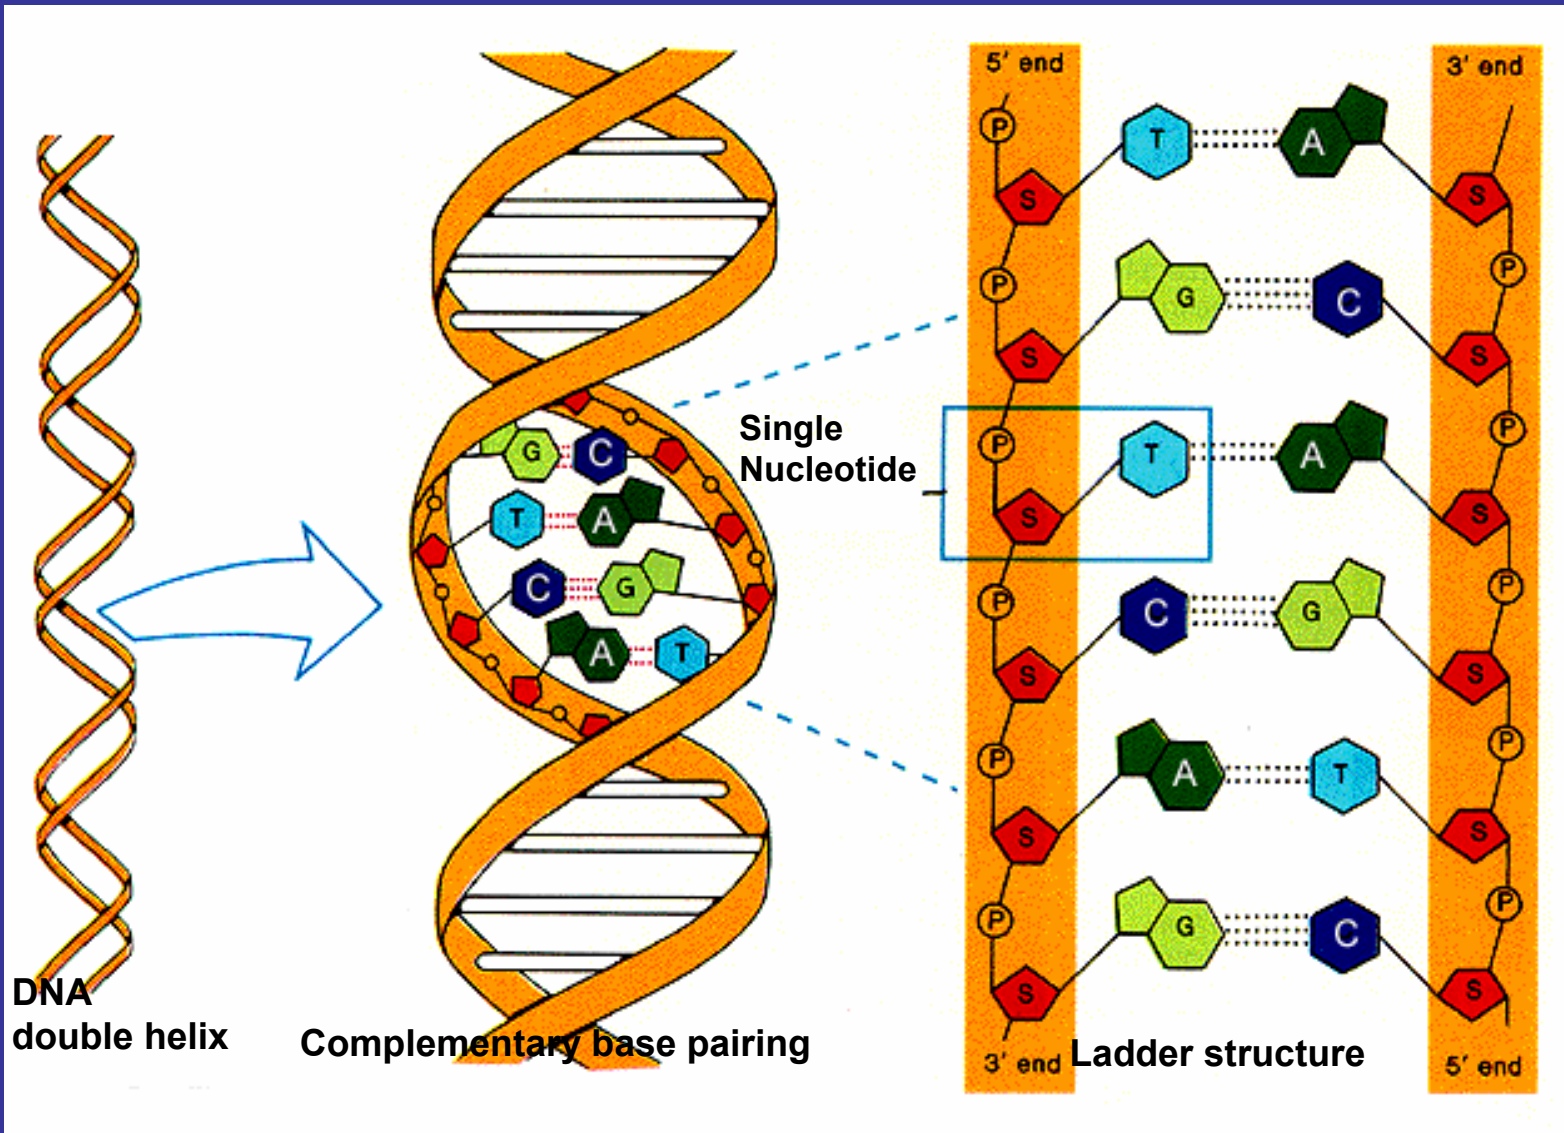

**What Is Measured in  
Microarrays**

**Microarray Analysis**

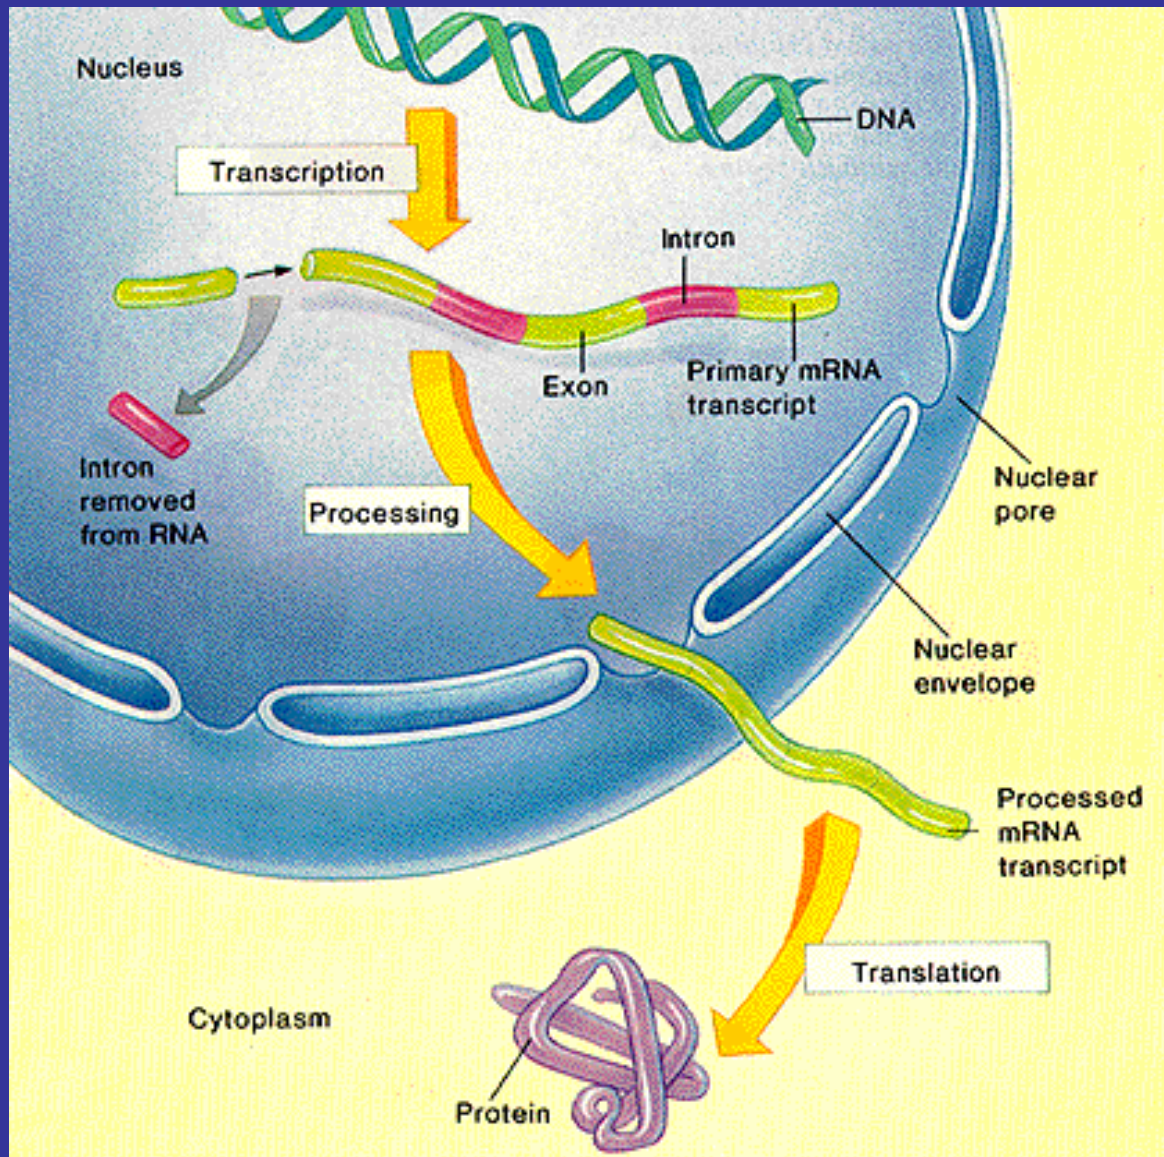

**Market of Ideas: Progress &  
Confusion**

**Collaborator Model**

# What Is DNA?

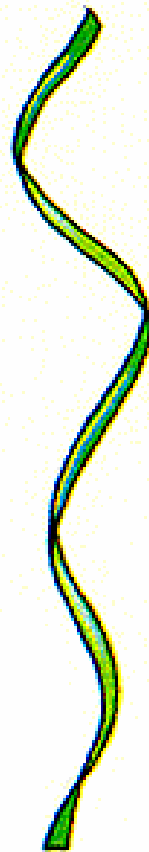

# What Is Gene Expression?

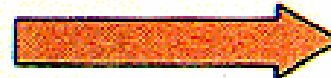

**DNA**

Transcription

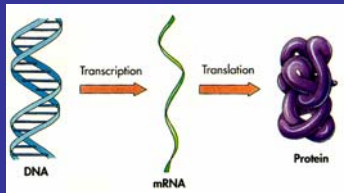

**mRNA**

Translation

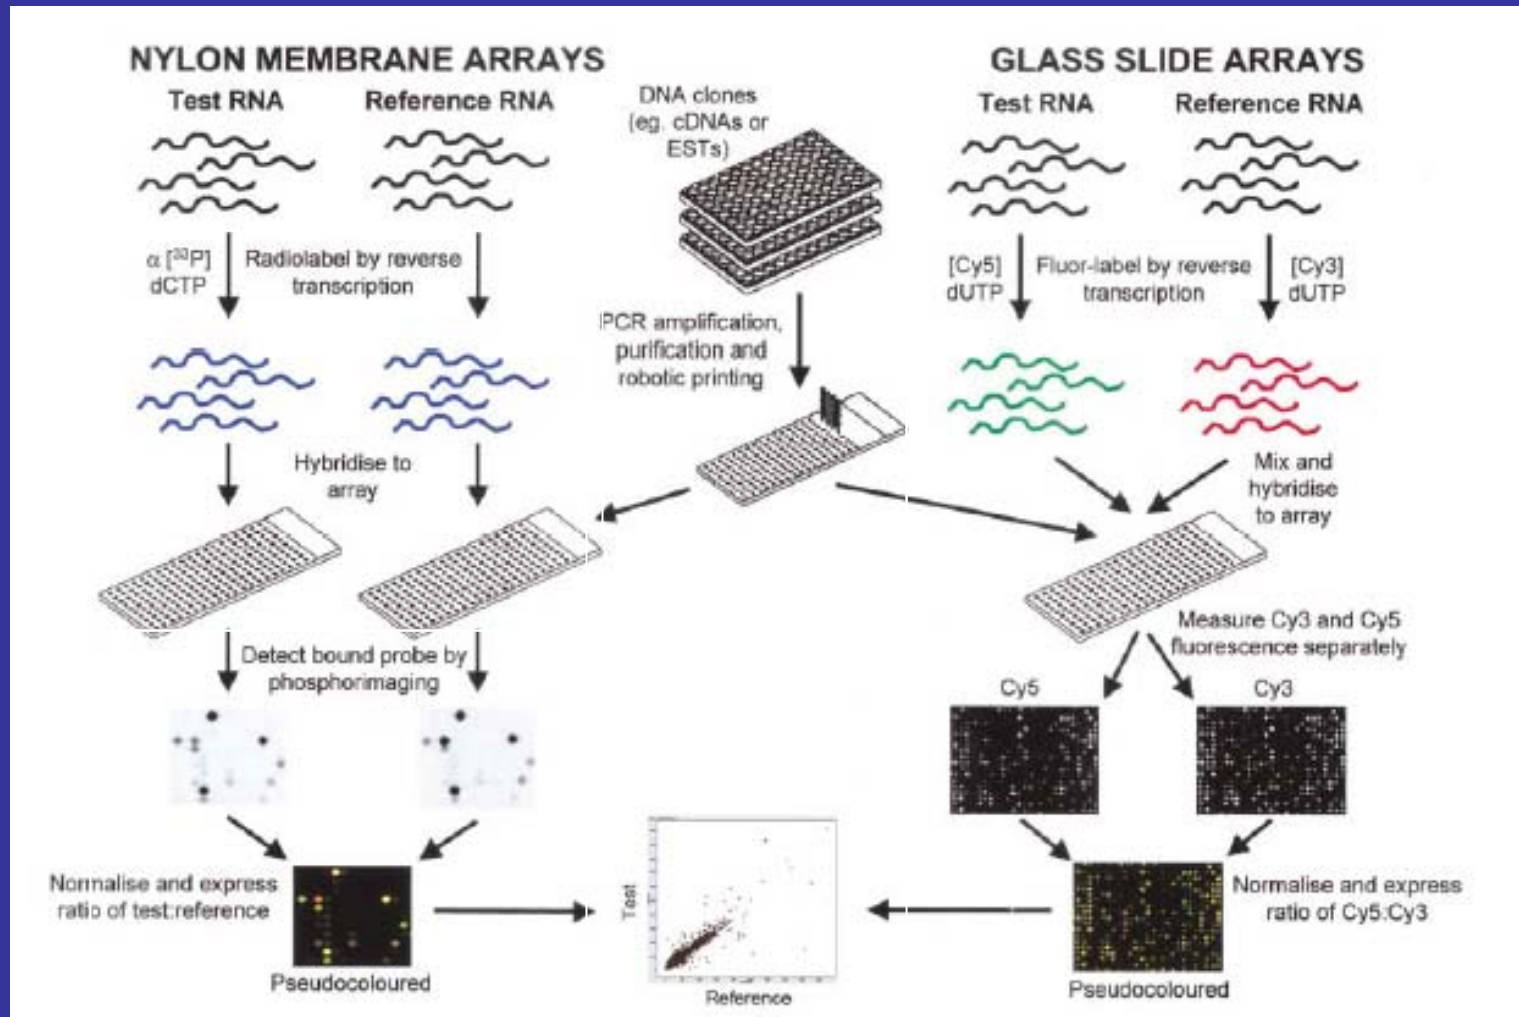

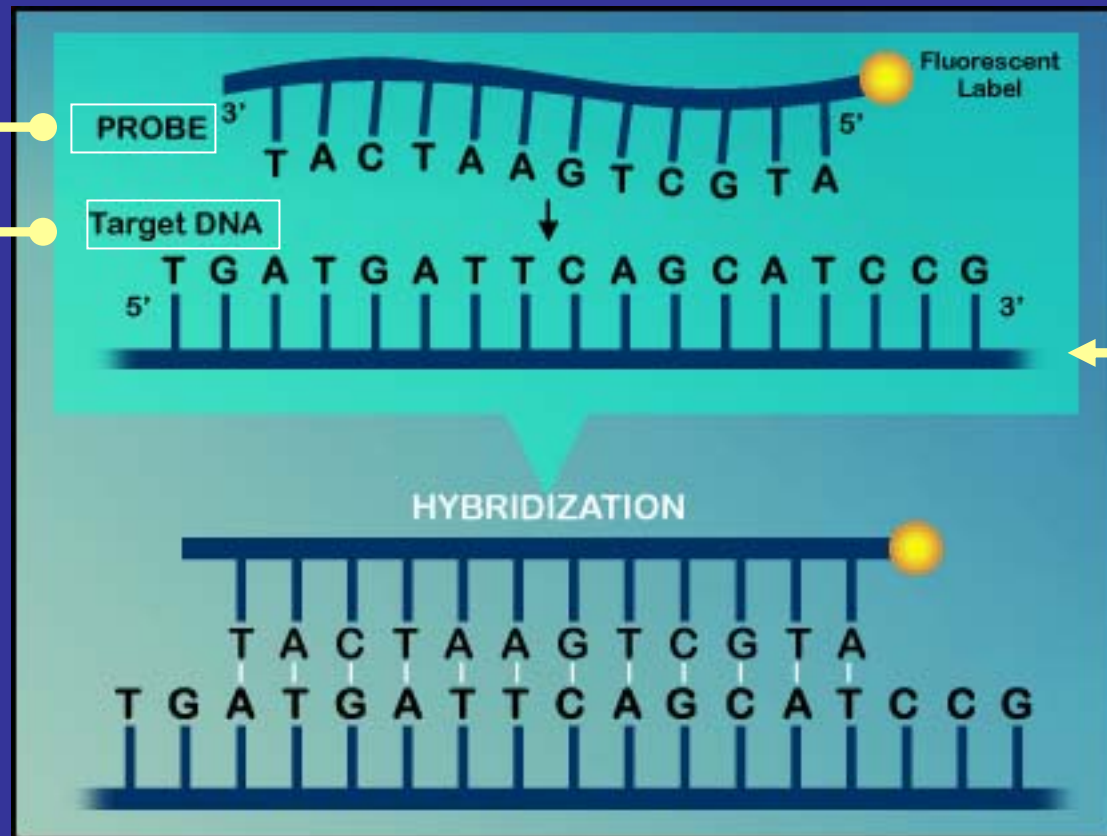

**Protein**

# cDNA Arrays

Reverse  
Transcription

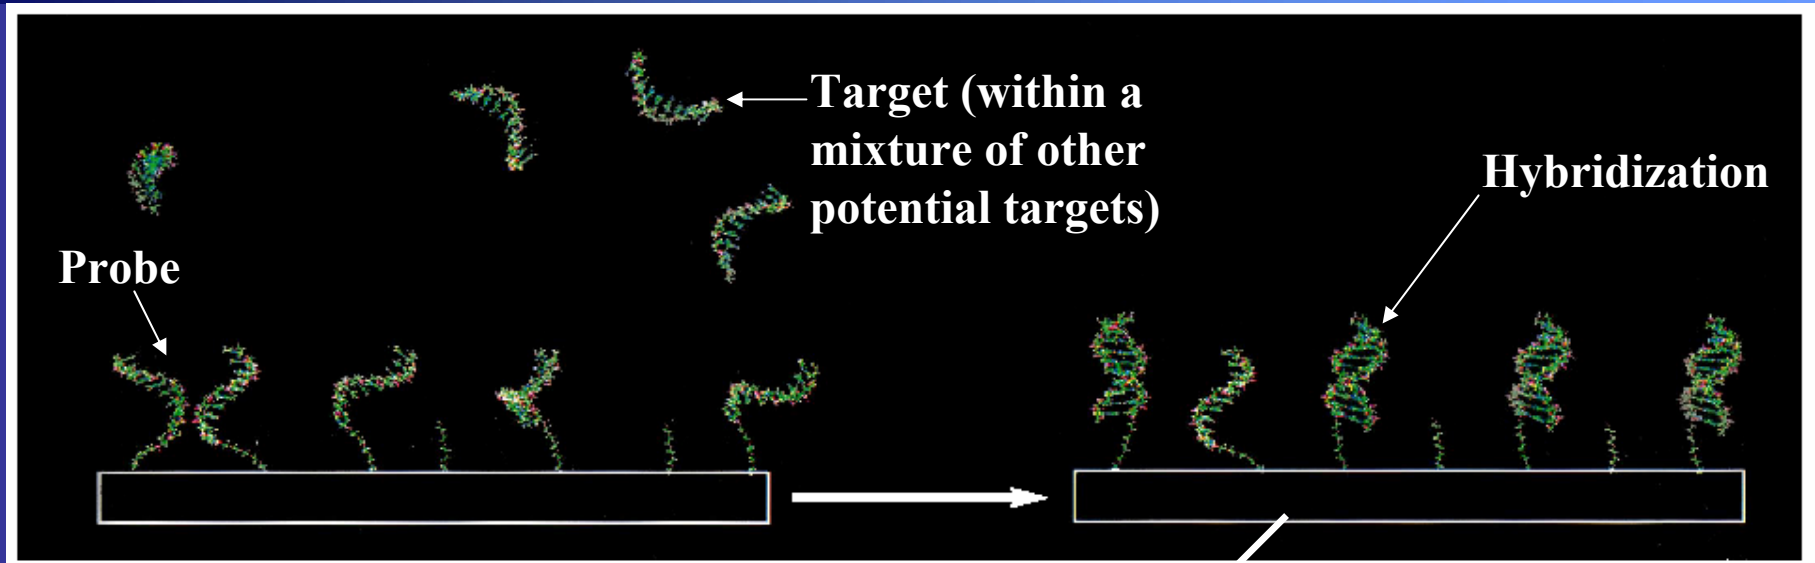

Target

Probe

Substrate

# Nucleic Acid Hybridization

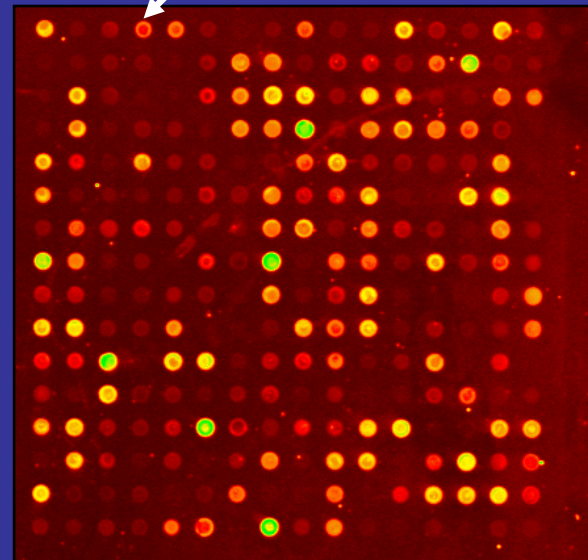

## Pseudo-Colour

Red: Cy5 Channel Up-regulated

Green: Cy3 Channel Up-regulated

Yellow: No change

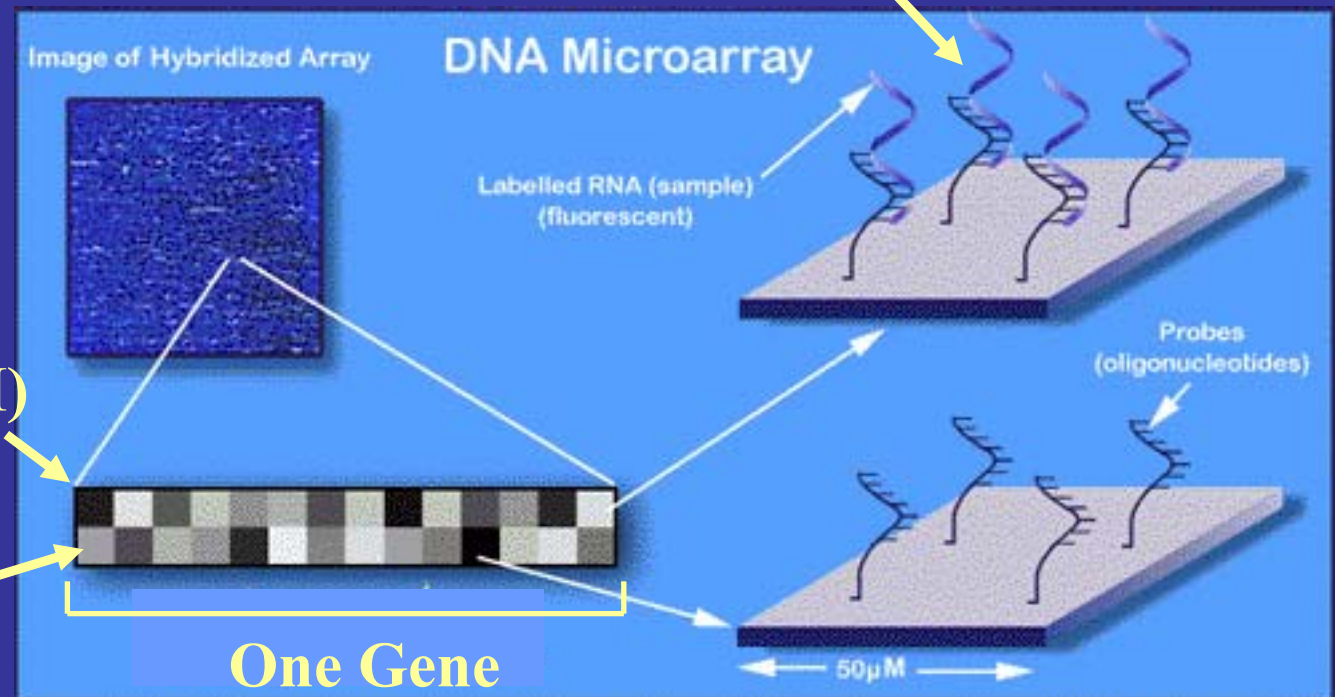

# Affymetrix Arrays

Oligonucleotides (Short sequences of RNA)

Perfect Match (PM)

Mismatch (MM)

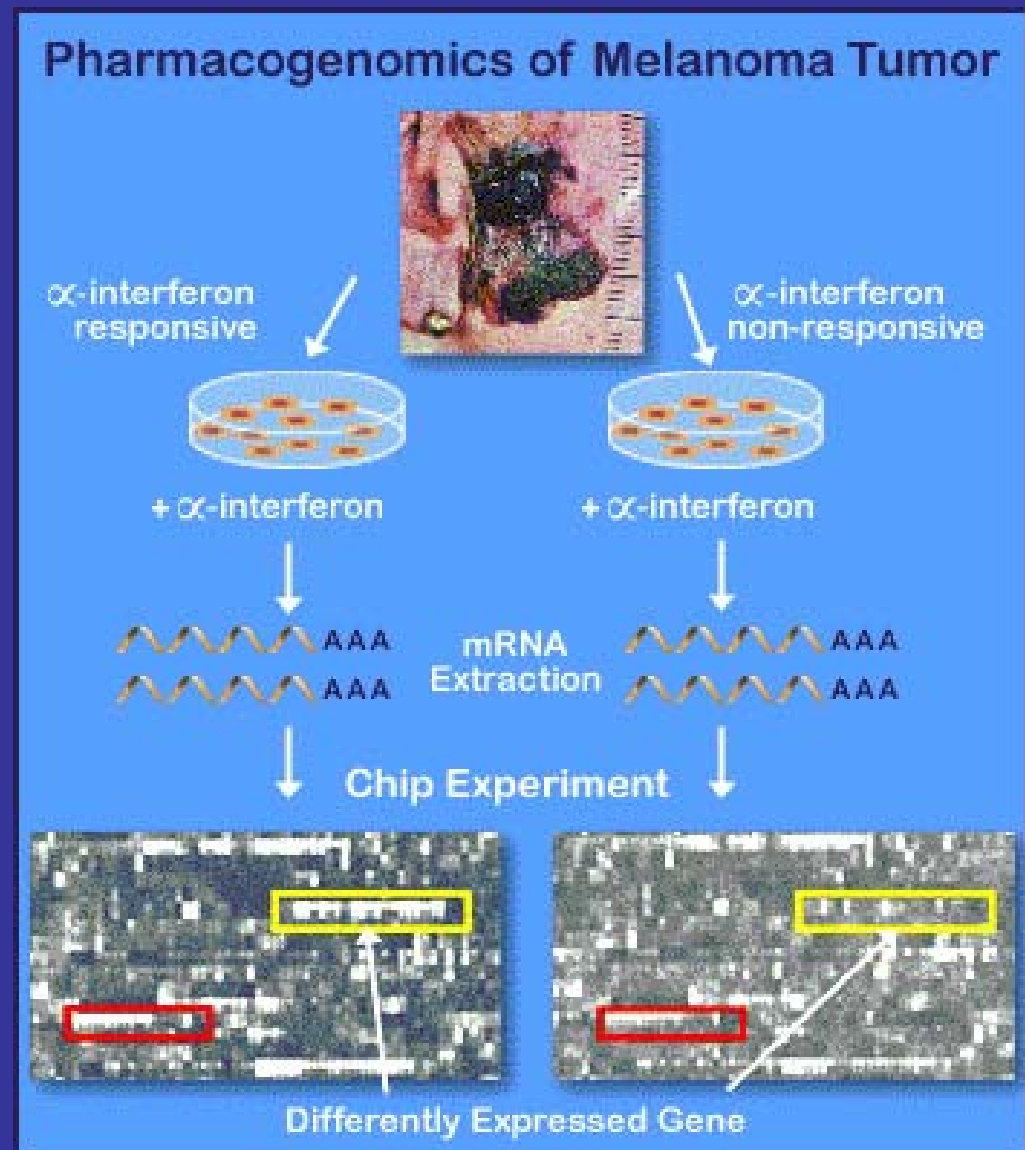

# Comparative Study

## Tumor Tissues

Same initial  
diagnosis  
(Phenotype) but  
different response to  
treatment

So investigate  
potential differences  
in underlying  
genotype

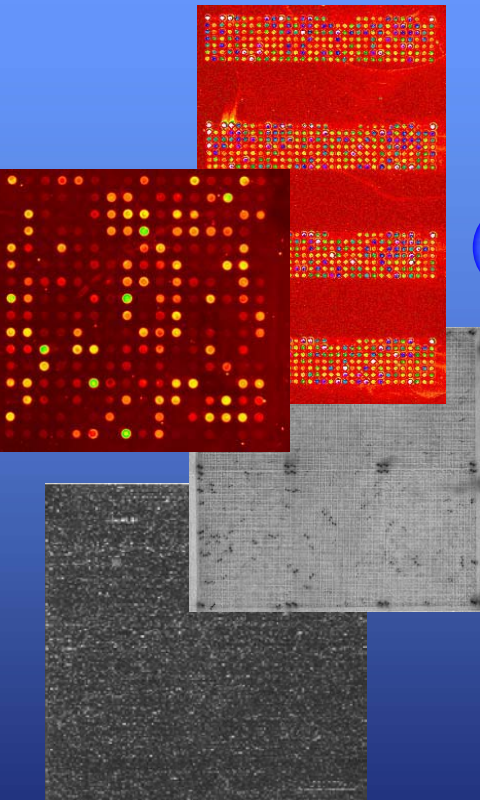

# What Is Measured in Microarrays

## ● Microarray Analysis

**Market of Ideas: Progress &  
Confusion**

**Collaborator Model**

# Evolution of Gene Expression Analysis

Visual Assessment

Quantification (Informal Inference Rules)

Low Level  
Statistical Analysis

Pattern  
Recognition/  
Visualization

Information  
Management

# Evolution of Gene Expression Analysis

Low Level  
Statistical Analysis

# Early Data Analysis Schematic

Quantify  
Array

$$n = 1$$

Pattern  
Recognition  
(Data  
Mining)

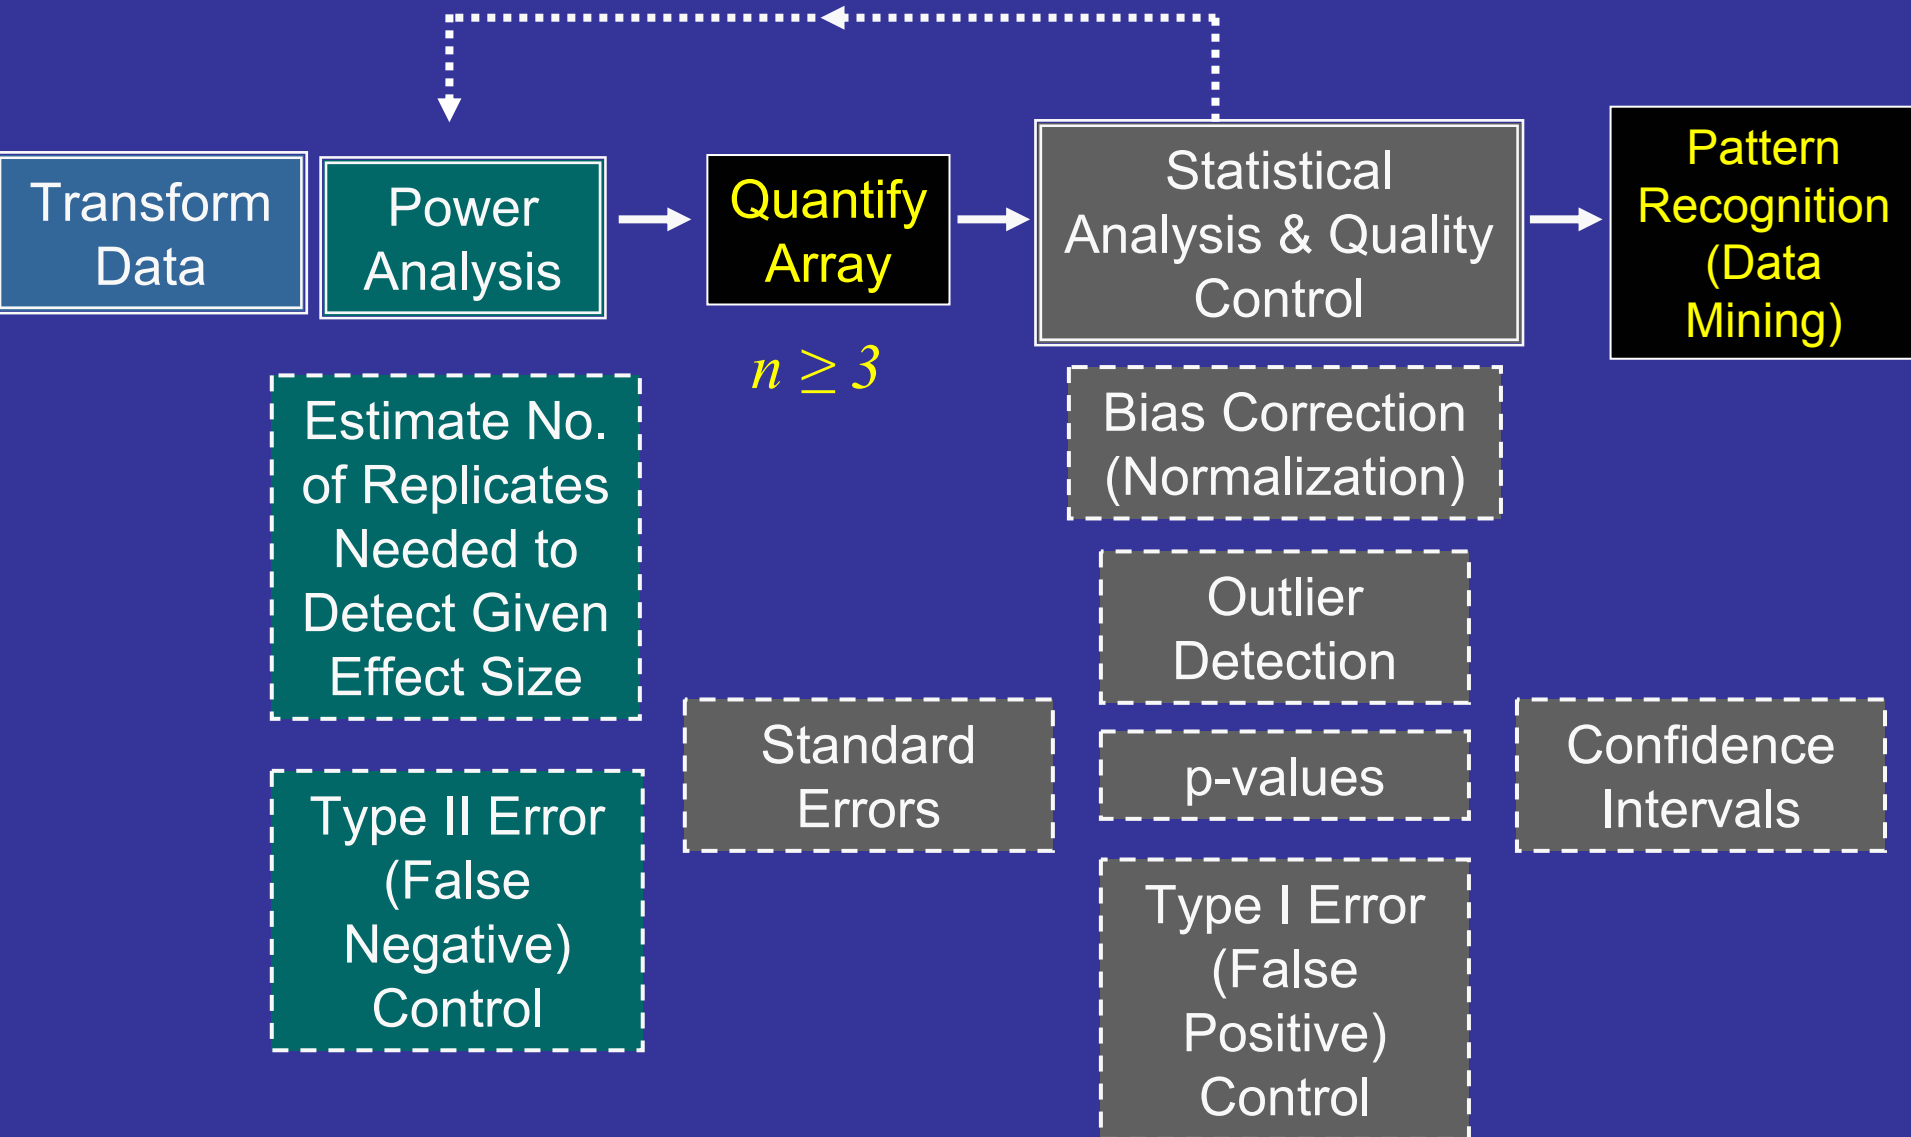

# Microarray Technology Oversold (or perhaps overbought)

Reliability and precision are less than initially thought

Partly due to

- Technology itself
- Poor study designs
- Neglect of low level preprocessing and analysis issues
  - ♦ Fundamental questions were not asked

# A Data Analysis Schematic

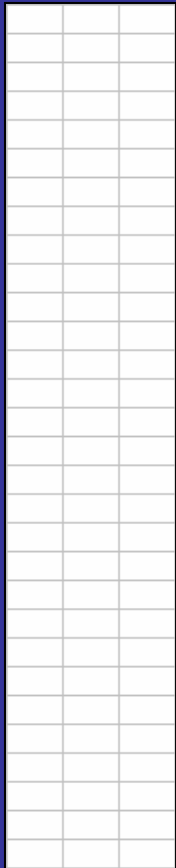

# Dimensionality Problem

“Standard” Experiment

3 Variables

30 Observations

Microarray Experiment

10,000+ “Gene Experiments”

1-3 Observations

# Important Statistical Issues for Low Level Analysis

Bias correction

- Background
- Normalization

Outliers

- Missing data

Data transformation

Random error estimation

Statistical testing of differential expression

- Multiple test problem

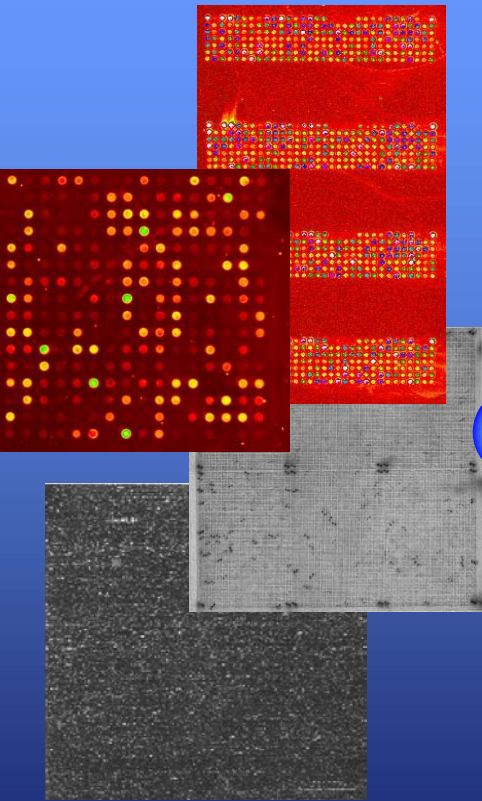

# Nontrivial Problems

Only small number of replicates typically available

Bottleneck occurs at data analysis stage

Hybridization of probes to targets is not sufficiently understood

- Problem of particular importance for Affymetrix technology

# What Is Measured in Microarrays

## Microarray Analysis

● **Market of Ideas: Progress &  
Confusion**

## **Collaborator Model**

# **Statistics: From Nothing to “Nothing But”**

Many statistical methods now available  
for all aspects of microarray studies

Usual discussion lines

- Bayesians versus frequentists
- “New” methods versus classical methods
- Nonparametric versus parametric
- Efficiency versus robustness
- Bias versus precision trade-off

Problems are difficult so not surprising  
that different solutions have emerged

But this has caused confusion among life  
scientists

Not simply a matter of the usual trade-offs  
and professional disagreements

Confusion reflects that

- No true gold standards exist in empirical data
- Not clear how to realistically simulate data

# Most Important Problem

Life scientists want lists of differentially expressed genes

- Different methods produce different lists
- Screening versus data mining

Which of the many available methods work best under which circumstances?

- Not very exciting but is a practical imperative
- Reproducibility
- Specificity versus sensitivity

Large funding sources will dry up if these issues are not addressed

# **Statistics Oversold (or perhaps overbought)**

Statisticians alone cannot provide the answers

Life scientists must be active participants in debate

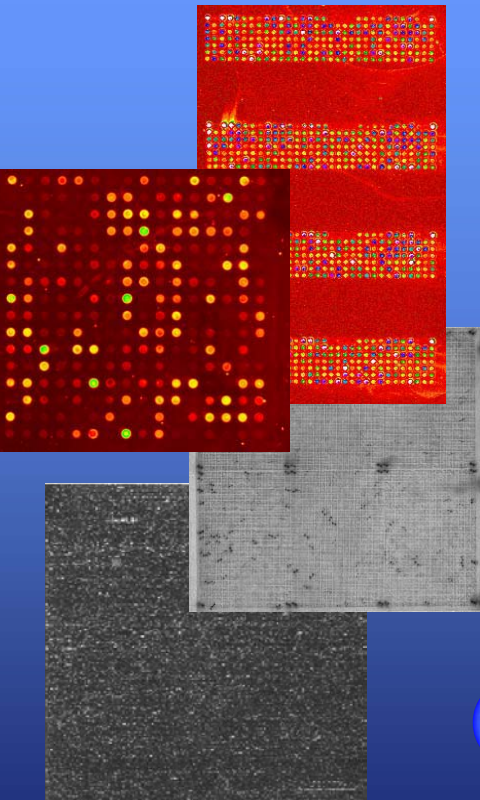

# The Dreaded “J” Word

Task for both groups is to “know what we don’t know”

Then learn as much as we need to learn... but not more

Most pressing problems are in data analysis - not data management

- Expression data & sequence are quite different

# What Is Measured in Microarrays

## Microarray Analysis

## Market of Ideas: Progress & Confusion

 **Collaborator Model**

# **“No offence but you’re really just a service provider”**

Life scientists at times appear to believe that the role of data analysts is to provide service

Statisticians at times appear to believe that life scientists are incapable of correctly analyzing their data

Neither viewpoint is healthy

# McGill University and Genome Quebec Innovation Centre

[www.innovation.mcgill.ca](http://www.innovation.mcgill.ca)

# Collaborator Model

Only reasonable model for now

- But really quite inadequate

# The Future

Freedom from statisticians for standard designs

Easy-to-use software

- Avoid pitfalls of other fields with button-click software

Textbooks

# Still Not There Yet

Microarray analysis  $\neq$  Clinical Trial  
analysis

# How Do We Get There?

## John Weinstein's (NCI) Bioinformatician Categories (*Revised*)

- Developmental
- Applied
- Experimental Design (Applied Statistics)

# Question to a River Pilot

Q: “Do you know where all the rocks are?”

A: “No, but I sure know where they ain’t”.

For microarrays, we don’t yet have the knowledge of the river pilot... but we have spotted some of the rocks.
