

# Semistrict Tamsamani's $n$ -groupoids and connected $n$ -types

Simona Paoli

Department of Mathematics  
Macquarie University, Sydney

Higher Categories and Their Applications  
Fields Institute, 10 January 2007

## Modelling homotopy types: overview

- Motivation: Higher order version of fundamental group (Grothendieck)

- Parallel developments:

### Homotopy Theory

Cat<sup>n</sup>-groups  
Hypercrossed complexes  
...

### Higher categories

"conjecture test":  
weak  $n$ -groupoids  
model  $n$ -types  
  
e.g. Tamsamani,  
Batanin model

- Low dimensions

$n = 2$  strict 2-groupoids model 2-types.

$n = 3$  Gray groupoids model 3-types  
[Joyal - Tierney; Leroy]

- Semistrictification hypothesis

Weak  $n$ -groupoids suitably equivalent to  
"semistrict" ones.

- Main result Every Tamsamani weak  $n$ -groupoid representing a connected  $n$ -type is suitably equivalent to a "semistrict" one.

- Method Comparison between cat <sup>$n-1$</sup> -groups and Tamsamani's weak  $n$ -groupoids.

## Internal categories and simplicial objects.

$\mathcal{C}$  category with finite limits

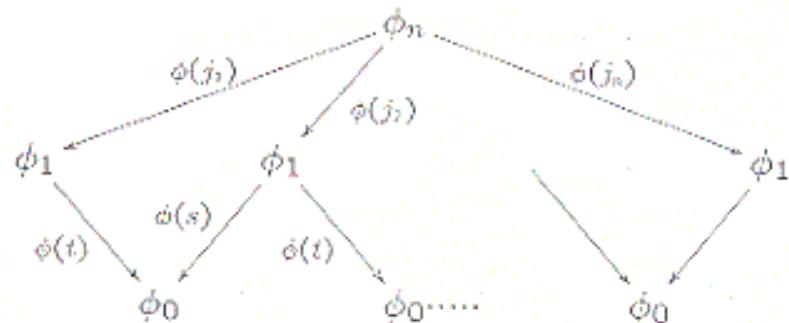

- The category  $\text{Cat}\mathcal{C}$ :

Objects:

$$C_1 \times_{C_0} C_1 \xrightarrow{c} C_1 \xrightarrow{\begin{matrix} d_0 \\ d_1 \\ i \end{matrix}} C_0 \quad + \text{ axioms}$$

- Nerve functor  $\text{Ner} : \text{Cat}\mathcal{C} \rightarrow [\Delta^{\text{op}}, \mathcal{C}]$

- Segal maps  $\phi \in [\Delta^{\text{op}}, \mathcal{C}] \quad \phi[n] = \phi_n$

$$t(0) = 1 \quad s(0) = 0 \quad j_r(0) = r - 1 \quad j_r(1) = r$$

Hence maps

$$\eta_n : \phi_n \rightarrow \phi_1 \times_{\phi_0} \cdots \times_{\phi_0} \phi_1$$

- Fact:  $\phi$  nerve of  $\text{Cat}\mathcal{C}$  iff for all  $n \geq 2$   $\eta_n$  isomorphism

## $\text{Cat}^n$ -groups: Definitions

- Definition:  $\text{Cat}^0(\text{Gp}) = \text{Gp}$

$$\text{Cat}^n(\text{Gp}) = \text{Cat}(\text{Cat}^{n-1}(\text{Gp}))$$

- Multinerve  $\mathcal{N} : \text{Cat}^n(\text{Gp}) \rightarrow [\Delta^{n\text{op}}, \text{Gp}]$

$$\text{Cat}^n(\text{Gp}) \xrightarrow{\mathcal{N}_{er}} [\Delta^{op}, \text{Cat}^{n-1}(\text{Gp})] \xrightarrow{\mathcal{N}_{er}}$$

$$[\Delta^{op}, [\Delta^{op}, \text{Cat}^{n-2}(\text{Gp})]] = [\Delta^{2op}, \text{Cat}^{n-2}(\text{Gp})] \rightarrow \dots$$

- Equivalent definition of  $\text{Cat}^n(\text{Gp}) \subset [\Delta^{n\text{op}}, \text{Gp}]$

$n=1$   $\mathcal{G} \in [\Delta^{op}, \text{Gp}]$ , Segal maps isos

Given  $\text{Cat}^{n-1}(\text{Gp}) \subset [\Delta^{n-1\text{op}}, \text{Gp}]$

Define  $\mathcal{G} \in \text{Cat}^n(\text{Gp}) \subset [\Delta^{n\text{op}}, \text{Gp}]$  if

- $\mathcal{G}_k \in \text{Cat}^{n-1}(\text{Gp})$  for all  $k \geq 0$
- Segal maps isomorphisms

- Classifying space  $B$

$$\begin{aligned} \text{Cat}^n(\text{Gp}) &\xrightarrow{\mathcal{N}} [\Delta^{n\text{op}}, \text{Gp}] \xrightarrow{\text{diag}} [\Delta^{op}, \text{Gp}] \xrightarrow{\overline{W}} \\ &[\Delta^{op}, \text{Set}]_0 \xrightarrow{|\cdot|} \text{Top}_* \end{aligned}$$

## $\text{Cat}^n$ -groups as homotopy models.

- Fact:  $\mathcal{G} \in \text{Cat}^n(\text{Gp})$   
Then  $B\mathcal{G}$  is connected  $(n+1)$ -type.
- Weak equivalence  $f$  in  $\text{Cat}^n(\text{Gp})$  if  $Bf$  weak homotopy equivalence.

### • Theorem

[MacLane-Whitehead  $n = 1$ ]

[Loday; Bullejos-Cegarra-Duskin; Porter;  $n > 1$ ]

$$\overline{B} : \frac{\text{Cat}^n(\text{Gp})}{\sim} \simeq \text{Ho}\left(\begin{array}{c} \text{connected} \\ n+1\text{-types} \end{array}\right) : \overline{\mathcal{P}_n}$$

## Tamsamani's model: strict case

- Strict n-categories: Inductive definition
  - $1\text{-Cat} = \text{Cat}$
  - $n\text{-Cat} = ((n-1)\text{-Cat})\text{-Cat}$
- Fact:  $\mathcal{C}$  category with commuting coproducts  
 $\mathcal{C}\text{-Cat} \simeq (\text{Cat } \mathcal{C})_{disc} =$   
 $= \{\phi \in [\Delta^{op}, \mathcal{C}] \mid \phi_0 \text{ discrete, Segal maps isom.}\}$
- Multi-simplicial definition of n-Cat:  
 $n=1$   $\mathcal{G} \in [\Delta^{op}, \text{Set}]$ , Segal maps isomorphisms  
Given  $(n-1)\text{-Cat} \subset [\Delta^{(n-1)^{op}}, \text{Set}]$   
Define  $\mathcal{G} \in n\text{-Cat} \subset [\Delta^{n^{op}}, \text{Set}]$  if
  - $\mathcal{G}_k \in (n-1)\text{-Cat}$  for all  $k \geq 0$
  - $\mathcal{G}_0$  constant
  - Segal maps isomorphisms.
- Note:  $\mathcal{G}(0, -)$ ,  $\mathcal{G}(1, \dots, k, 1, 0, -)$  discrete  
 $1 \leq k \leq n-2$ .
- Functor:  $\tau_1^{(n)} : n\text{-Cat} \rightarrow \text{Cat}$ , inductively  
 $\tau_0^{(1)} : \text{Cat} \rightarrow \text{Set}$  iso class of objects  
 $\tau_1^{(1)} = \text{id}$        $\tau_1^{(n)} = \tau_0^{(n-1)}$        $\tau_0^{(n)} = \tau_0^{(1)} \tau_1^{(n)}$
- Strict n-groupoids:  
 $1\text{-Gpd} = \text{Gpd}$   
 $\mathcal{G} \in n\text{-Cat}$  is in  $n\text{-Gpd}$  if  $\mathcal{G}_k \in (n-1)\text{-Gpd}$  for all  $k \geq 0$  and  $\tau_1^{(n)} \mathcal{G} \in \text{Gpd}$ .

## Tamsamani's model: general case

- Idea: Weaken associativity of composition and unit laws by requiring Segal maps to be “equivalences” rather than isomorphisms.

- Inductive definition: [Tamsamani; Toën]

$n = 1 \quad \mathcal{W}_1 = \text{Cat}$

1-equivalence = equivalence of Cat

$\tau_0^{(1)} : \text{Cat} \rightarrow \text{Set}$  iso classes of objects

$\delta^{(1)} : \text{Set} \rightarrow \mathcal{W}_1$  discrete category

$\tau_1^{(1)} : \mathcal{W}_1 \rightarrow \text{Cat}$  identity.

- Note: these satisfy

i)  $\delta^{(1)}$  fully faithful, finite product preserving

$$\tau_0^{(1)} \delta^{(1)} = \text{id}.$$

ii)  $\tau_0^{(1)}$  sends 1-equiv. to bijections.

iii)  $\tau_0^{(1)}$  preserves fibre products over discrete objects.

iv)  $\mathcal{C} \rightarrow \mathcal{D}$  morphism in  $\mathcal{W}_1$ ,  $\mathcal{D}$  discrete

$$\text{then } \mathcal{C} \cong \coprod_{x \in \mathcal{D}} \mathcal{C}_x.$$

## Tamsamani's model: general case, cont.

### Inductive step:

- Given  $\mathcal{W}_{n-1}$ ,  $(n-1)$ -equivalences

$$\tau_0^{(n-1)} : \mathcal{W}_{n-1} \rightarrow \text{Set}$$

$\delta^{(n-1)} : \text{Set} \rightarrow \mathcal{W}_{n-1}$  image "discrete"

+ axioms

- Define  $\phi \in \mathcal{W}_n \subset [\Delta^{op}, \mathcal{W}_{n-1}]$  s.t.

$\phi_0$  discrete

Segal maps  $(n-1)$ -equivalences.

- Note  $\tau_1^{(n)} : \mathcal{W}_n \rightarrow \text{Cat}$  restriction of

$$\tau_0^{(n-1)} : [\Delta^{op}, \mathcal{W}_{n-1}] \rightarrow [\Delta^{op}, \text{Set}]$$

$$\phi_1 \cong \coprod_{x,y \in \phi_0} \phi_{(x,y)}$$

- Define  $f : \phi \rightarrow \psi$  in  $\mathcal{W}_n$   $n$ -equivalence if

-  $\phi_{(x,y)} \rightarrow \psi_{(fx,fy)}$   $(n-1)$ -equiv.

-  $\tau_1^{(n)} \phi \rightarrow \tau_1^{(n)} \psi$  equiv. of Cat

$$-\tau_0^{(n)} = \tau_0^{(1)} \tau_1^{(n)}$$

## Weak $n$ -groupoids as homotopy models.

- Tamsamani's weak  $n$ -groupoids  $\mathcal{T}_n \subset \mathcal{W}_n$

$n = 1$   $\mathcal{T}_1 = \text{Gpd}$

Given  $\mathcal{T}_{(n-1)}$

Define  $\phi \in \mathcal{T}_n \subset \mathcal{W}_n$  if

$\phi_{(x,y)} \in \mathcal{T}_{n-1}$  for all  $x, y \in \phi_0$

$\tau_1^{(n)} \phi \in \mathcal{T}_1$

- Theorem [Tamsamani]

Equivalence of categories

$$\overline{B} : \frac{\mathcal{T}_n}{\sim^n} \simeq \text{Ho}(n\text{-types}) : \overline{\Pi}_n$$

## $\text{Cat}^n$ -groups and $T_{n+1}$ : summary

$\text{Cat}^n(\text{Gp})$	$T_{n+1}$
• $\mathcal{G} \in [\Delta^{n^\sigma}, \text{Gp}]$	• $\phi \in [\Delta^{n+1^\sigma}, \text{Set}]$
$\mathcal{G}_k$ multinerve of $\text{Cat}^{n-1}(\text{Gp})$	$\phi_n \in T_n$
Segal maps iso.	$\phi_0$ constant
	Segal maps $n$ -equivalences
	$\tau_1^{(n+1)}\phi \in \text{Gpd}$
• multisimplicial inductive definition based on Gp strict structure “cubical”	• multisimplicial inductive definition based on Set weak structure “globular”

- Main issues in the comparison:

- i) From strict cubical structure to weak globular one while preserving homotopy type.
- ii) From group-based structure to set-based structure.

## Comparison problem: main ideas.

- Internal weak  $n$ -groupoids  $\mathbb{D}_n \subset [\Delta^{n\text{op}}, \text{Gp}]$

Weak globular structures internal to  $\text{Gp}$ .

- Functors  $\text{Cat}^n(\text{Gp}) \xrightarrow{\text{disc}} \mathbb{D}_n \xrightarrow{V} \mathcal{H}_{n+1} \subset \mathcal{T}_{n+1}$   
preserving the homotopy type.

- Special  $\text{cat}^n$ -groups  $\text{Cat}^n(\text{Gp})_s \subset \text{Cat}^n(\text{Gp})$

The “faces” which in an object of  $n\text{-Cat}(\text{Gp})$  are discrete are now “strongly contractible”.

In particular  $n\text{-Cat}(\text{Gp}) \subset \text{Cat}^n(\text{Gp})_s$

- Discretization functor  $\text{disc}$

$\text{Cat}^n(\text{Gp}) \xrightarrow{Sp} \text{Cat}^n(\text{Gp})_s \xrightarrow{\mathcal{D}_n} \mathbb{D}_n$

$Sp$  cofibrant replacement functor

$\mathcal{D}_n$  “squeezes contractible faces to discrete ones”.

- Semistrict  $(n+1)$ -groupoids  $\mathcal{H}_{n+1}$

$V : \mathbb{D}_n \rightarrow \mathcal{H}_{n+1}$

induced by nerve  $\text{Gp} \rightarrow [\Delta^{\text{op}}, \text{Set}]$

## $\text{Cat}^n$ -groups: further properties.

- $\text{Cat}^n(\text{Gp})$  as algebraic category

$$\mathcal{U}_n : \text{Cat}^n(\text{Gp}) \rightarrow \text{Set} : \mathcal{F}_n \quad \mathcal{F}_n \dashv \mathcal{U}_n$$

$\mathcal{U}_n$  monadic.

- Regular epis

$\text{Cat}^n(\text{Gp})$  has enough regular epi projectives

$$\mathcal{F}_n \mathcal{U}_n \mathcal{G} \xrightarrow{\epsilon_{\mathcal{G}}} \mathcal{G}$$

- Strongly contractible (s.c.)  $\text{cat}^n$ -groups

$$\underline{n=1} \quad d : \mathcal{G} \rightrightarrows \mathcal{G}^d : t \quad dt = \text{id}$$

$\mathcal{G}^d$  discrete,  $d$  w.e.

Given s.c.  $\text{Cat}^{n-1}(\text{Gp})$

Define  $\mathcal{G} \in \text{Cat}^n(\text{Gp})$  s.c. if

$$d : \mathcal{G} \rightrightarrows \mathcal{G}^d : t \quad dt = \text{id}$$

$\mathcal{G}^d$  discrete,  $d$  w.e.

$\mathcal{G}_0^{(k)}, \mathcal{G}_1^{(k)}$  s.c.  $\text{Cat}^{n-1}(\text{Gp})$

for all directions  $1 \leq k \leq n$ .

- Theorem:  $\mathcal{F}_n X$  is strongly contractible.

## A model structure on $\text{Cat}^n(\text{Gp})$ .

$$\text{Cat}^n(\text{Gp}) = \text{Cat}(\text{Cat}^{n-1}(\text{Gp}))$$

Apply T. Everaert, R.W. Kieboom,

T. Van der Linden - TAC 2005

- Weak equiv. = homology isomorphisms
- Every object is fibrant
- Functorial cofibrant replacement

$\mathcal{G} \in \text{Cat}^n(\text{Gp}) \quad \text{pullback in } \text{Cat}^{n-1}(\text{Gp})$

$$\begin{array}{ccc} \mathcal{P}_1 & \longrightarrow & \mathcal{F}_{n-1}\mathcal{U}_{n-1}\mathcal{G}_0 \times \mathcal{F}_{n-1}\mathcal{U}_{n-1}\mathcal{G}_0 \\ \downarrow & \text{pullback} & \downarrow \varepsilon \times \varepsilon \\ \mathcal{G}_1 & \xrightarrow{(d_0, d_1)} & \mathcal{G}_0 \times \mathcal{G}_0. \end{array}$$

$c(\mathcal{G}) \in \text{Cat}^n(\text{Gp})$

$c(\mathcal{G})_1 = \mathcal{P}_1 \quad c(\mathcal{G})_0 = \mathcal{F}_{n-1}\mathcal{U}_{n-1}\mathcal{G}_0$

$c(\mathcal{G})$  cofibrant

$c(\mathcal{G}) \rightarrow \mathcal{G}$  trivial fibration  $Bc(\mathcal{G}) \simeq B\mathcal{G}$

## The discretization functor, $n=2$ .

- Special cat<sup>2</sup>-groups  $\mathcal{G} \in \text{Cat}^2(\text{Gp})_s$   
 $\mathcal{G}_0$  is s.c. cat<sup>1</sup>-group,  $d : \mathcal{G}_0 \xrightarrow{\sim} \mathcal{G}_0^d : t \mapsto dt = \text{id}$
- Functor  $c : \text{Cat}^2(\text{Gp}) \rightarrow \text{Cat}^2(\text{Gp})_s$   
 $c(\mathcal{G}) \rightarrow \mathcal{G}$  weak equivalence.
- Internal weak 2-groupoids  $\mathbb{D}_2 \subset [\Delta^{op}, \text{Cat}^1(\text{Gp})]$   
 $\mathcal{G} \in \mathbb{D}_2$  if
  - $\mathcal{G}_0$  discrete
  - Segal maps w.e.
- Discrete multinerve  $ds\mathcal{N}\mathcal{G}$   
 $ds\mathcal{N} : \text{Cat}^2(\text{Gp})_s \rightarrow \mathbb{D}_2$

$$\cdots \mathcal{G}_1 \times_{\mathcal{G}_0} \mathcal{G}_1 \xrightarrow{\sim} \mathcal{G}_1 \xrightarrow{\frac{d\partial_0}{\sigma_0 t}} \mathcal{G}_0^d$$

$\mathcal{D}_2 = ds\mathcal{N}$  preserves homotopy type

- Define  $disc = \mathcal{D}_2 \circ c$

## Semistrictification, n=2.

- Semistrict 3-groupoids  $\mathcal{H}_3 \subset \mathcal{T}_3$

$\mathcal{G} \in \mathcal{H}_3 \subset [\Delta^{op}, \mathcal{T}_2]$  if  $\mathcal{G}_0 = \{*\}$

$$\mathcal{G}_n \cong \mathcal{G}_1 \times \cdots \times \mathcal{G}_1$$

- Functor  $V : \mathbb{D}_2 \rightarrow \mathcal{H}_3$

induced by nerve  $Gp \rightarrow [\Delta^{op}, \text{Set}]$ .

$V$  preserves homotopy type.

- Theorem [P.] Commutative diagram

$$\begin{array}{ccc} \mathbf{Cat}^2(Gp)/\sim & \xrightarrow{V \circ disc} & \mathcal{H}_3/\sim^3 \\ & \searrow B & \swarrow B \\ & \mathcal{H}_0(\text{connected 3-types}) & \end{array}$$

Further, every object of  $\mathcal{T}_3$  representing a connected 3-type is equivalent to an object of  $\mathcal{H}_3$  through a zig-zag of 3-equivalences in  $\mathcal{T}_3$ .

## The connection with Gray groupoids.

- Gray groupoids.

Gray = (2-cat,  $\otimes_{gray}$ ).

Gray-enriched category with invertible cells.

(Gray-Gpd)<sub>0</sub> = Gray groupoids with 1 object.

- Theorem [P.] Commutative diagram

$$\begin{array}{ccc} \mathcal{H}_3 / \sim^3 & \xrightarrow{S} & (\text{Gray-Gpd})_0 / \sim \\ & \searrow B & \swarrow B \\ & \mathcal{H}_0(\text{connected 3-types}) & \end{array}$$

- idea of proof

- Monoidal functor

$$(\mathcal{T}_2, \times) \xrightarrow{G} (\text{Bigpd}, \times) \xrightarrow{st} (\text{2-gpd}, \otimes_{gray})$$

- note  $\mathcal{H}_3 \subset \text{Mon}(\mathcal{T}_2, \times)$

-  $\mathcal{G} \in \mathcal{H}_3 \Rightarrow st G \mathcal{G} \in (\text{Gray-Gpd})_0$

Let  $S(\mathcal{G}) = st G \mathcal{G}$ .

## Special $\text{cat}^3\text{-groups}$ .

- Notation

$\text{Cat}^1(\text{Gp})$

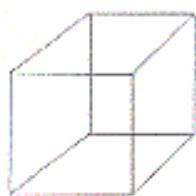

$\text{Cat}^2(\text{Gp})$

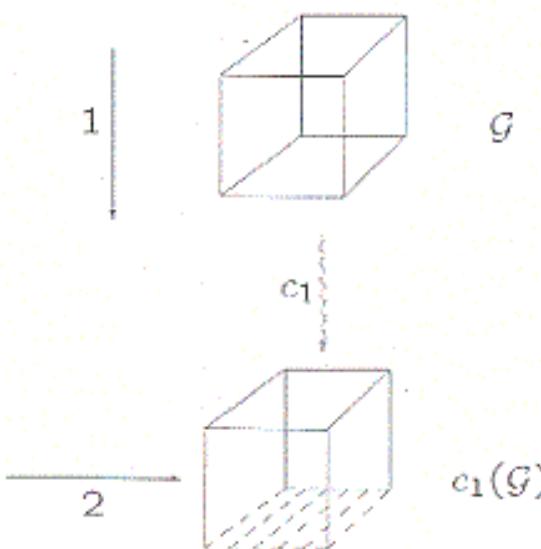

internal category in  
 $\text{Cat}(\text{Gp})$  in 2 ways

$\text{Cat}^3(\text{Gp})$

internal category in  
 $\text{Cat}^2(\text{Gp})$  in 3 ways

- Functor

$c_1, c_2$   
cofibrant  
replacements

$$c_2c_1(\mathcal{G}) = \text{Sp } \mathcal{G}$$

$$\left. \begin{array}{ll} (\text{Sp } \mathcal{G})_0 & \text{s.c. } \text{Cat}^2(\text{Gp}) \\ (\text{Sp } \mathcal{G})_1 & \text{special } \text{Cat}^2(\text{Gp}) \end{array} \right\} \begin{array}{l} \text{Sp } \mathcal{G} \text{ special} \\ \text{Cat}^3(\text{Gp}) \end{array}$$

$\text{Sp } \mathcal{G} \rightarrow c_1(\mathcal{G}) \rightarrow \mathcal{G}$  w.e.

## Discretization functor, $n = 3$ .

- Nerve of special cat<sup>3</sup>-groups

$$Ner : \text{Cat}^3(\text{Gp})_s \rightarrow [\Delta^{op}, \text{Cat}^2(\text{Gp})_s]$$

$$\cdots \begin{array}{c} \square \\ \times \\ \square \end{array} \rightarrow \begin{array}{c} \square \\ \rightarrow \\ \square \end{array} \rightarrow \begin{array}{c} \square \\ \rightarrow \\ \square \end{array} \rightleftarrows \begin{array}{c} \square \\ \rightarrow \\ \square \end{array}$$

- Discrete multinerve

$$ds\mathcal{N} : \text{Cat}^3(\text{Gp}) \rightarrow [\Delta^{op}, \text{Cat}^2(\text{Gp})_s]$$

- Internal weak 3-groupoids  $\mathcal{G} \in \mathbb{D}^3 \subset [\Delta^{op}, \mathbb{D}^2]$ .

$\mathcal{G}_0$  discrete, Segal maps w.e.

- Functor  $\mathcal{D}_3 : \text{Cat}^3(\text{Gp})_s \rightarrow \mathbb{D}_3$

$$\mathcal{D}_3 = \overline{\mathcal{D}}_2 \circ ds\mathcal{N}$$

$$\mathcal{G} \quad \cdots \mathcal{G}_1 \times_{\mathcal{G}_0} \mathcal{G}_1 \xrightarrow{\cong} \mathcal{G}_1 \xrightarrow{\cong} \mathcal{G}_0$$

$$\mathcal{D}_3 \mathcal{G} \quad \cdots \mathcal{D}_2(\mathcal{G}_1 \times_{\mathcal{G}_0} \mathcal{G}_1) \xrightarrow{\cong} \mathcal{D}_2(\mathcal{G}_1) \xrightarrow{\cong} \mathcal{G}_0^d = \mathcal{D}_2(\mathcal{G}_0^d)$$

preserves homotopy type

- Discretization  $disc : \text{Cat}^3(\text{Gp}) \rightarrow \mathbb{D}_3$

$$disc = \mathcal{D}_3 \circ Sp$$

## Semistrictification, general $n$ .

- Semistrict Tamsamani's  $n+1$ -groupoids  $\mathcal{H}_{n+1}$   
 $\phi \in \mathcal{H}_{n+1} \subset \mathcal{T}_{n+1} \subset [\Delta^{\text{op}}, \mathcal{T}_n]$  if  
 $\phi_0 = \{*\}, \quad \phi_n \cong \phi_1 \times \cdots \times \phi_1$
- Functor  $V : \mathbb{D}_n \rightarrow \mathcal{H}_{n+1}$   
induced by nerve  $\text{Gp} \rightarrow [\Delta^{\text{op}}, \text{Set}]$   
 $V$  preserves homotopy type.
- Theorem [P.] Commutative diagram

$$\begin{array}{ccc} \text{Cat}^n(\text{Gp})/\sim & \xrightarrow{V \circ \text{disc}} & \mathcal{H}_{n+1}/\sim^{n+1} \\ & \searrow B & \swarrow B \\ & \mathcal{H}o(\text{connected } n+1\text{-types}) & \end{array}$$

Further, every object of  $\mathcal{T}_{n+1}$  representing a connected  $(n+1)$ -type is equivalent to an object of  $\mathcal{H}_{n+1}$  through a zig-zag of  $(n+1)$ -equivalences in  $\mathcal{T}_{n+1}$ .

## Discretization functor, general n.

- Special  $\text{Cat}^n(\text{Gp})$  inductive definition.  
 $\mathcal{G} \in \text{Cat}^n(\text{Gp})_s$  if  $\mathcal{G}_0^{(k)}$  is s.c. and  $\mathcal{G}_1^{(k)}$  is special for some direction  $k$ ,  $1 \leq k \leq n$ .
- Functor  $Sp : \text{Cat}^n(\text{Gp}) \rightarrow \text{Cat}^n(\text{Gp})_s$   
 $Sp = c_{n-1} \circ c_{n-2} \circ \cdots \circ c_2 \circ c_1$   
 $Sp \mathcal{G} \rightarrow \mathcal{G}$  w.e.
- Nerve of  $\text{Cat}^n(\text{Gp})_s$   
 $\text{Ner} : \text{Cat}^n(\text{Gp})_s \rightarrow [\Delta^{\text{op}}, \text{Cat}^{n-1}(\text{Gp})_s]$
- Discrete multinerve  
 $ds\mathcal{N} : \text{Cat}^n(\text{Gp})_s \rightarrow [\Delta^{\text{op}}, \text{Cat}^{n-1}(\text{Gp})_s]$
- Internal weak  $n$ -groupoids  $\mathcal{G} \in \mathbb{D}_n \subset [\Delta^{\text{op}}, \mathbb{D}_{n-1}]$   
 $\mathcal{G}_0$  discrete, Segal maps w.e.
- Functor  $\mathcal{D}_n : \text{Cat}^n(\text{Gp})_s \rightarrow \mathbb{D}_n$   
 $\mathcal{D}_n = \overline{\mathcal{D}}_{n-1} \circ ds\mathcal{N}$   
preserves homotopy type  
 $\mathcal{D}_n(\mathcal{G}) = \mathcal{G}$  if  $\mathcal{G} \in n\text{-Cat}(\text{Gp})$
- Discretization  $disc : \text{Cat}^n(\text{Gp}) \rightarrow \mathbb{D}_n$   
 $disc = \mathcal{D}_n \circ Sp$
