Definition of the Problem

- Injection Drug Users (IDU) are at high risk for contracting HIV
- Worldwide problem, including Canada
- Vancouver's Downtown Eastside (DTES) has among the worst HIV epidemic in North America
- Needle exchange programs seem to have contributed to declines but incidence remains high

Definition of the Problem

**Proportion of positive HIV tests attributed to IDU in Canada
(PHAC, 2006)**

A large, semi-transparent red ribbon graphic is positioned on the left side of the slide, looping around and partially covering the text.

Definition of the Problem

- So, what drives the HIV epidemic?
- HIV transmission among IDU has at least two components:
 - Biological and Mechanical Component**
 - à Efficiency of viral transmission through a contaminated needle
 - Social Component**
 - à Social context leading to sharing of contaminated needles
- Need to understand the effects of social influence to understand the epidemic

7. Assumptions and Limitations
8. Conclusions
9. Future Work

A large, stylized red ribbon graphic, commonly associated with HIV/AIDS awareness, is positioned on the left side of the slide. It is partially transparent, allowing the text to be seen through it.

Why use a CA model?

- Understand effect of micro-level interactions on macro-level process
- Specifically, effect of individual behaviour and interpersonal interaction on the HIV epidemic in the population
- Social interactions occur in a spatial context and CA can incorporate this

Agents

0. **Stayer** is someone who will never use drugs.
1. **Susceptible** is someone who does not currently use drugs via injection, but could become an IDU.
2. **IDU** is an injection drug user who does not carry the HIV virus.
3. **IDU-HIV** is an injection drug user who carries the HIV virus.
4. **HIV** is someone who contracted the HIV virus through injection drug use and then stopped the use of drugs.

Social Counters

- A counter $C_i(t)$ records the influences of one's neighbours associated with each cell

$$C_1(t) = C_1(t - 1) + R_0 v_{01} + R_1 u_1 + R_2 v_{21} + R_3 v_{31} + R_4 v_{41}$$

$$C_2(t) = C_2(t - 1) + R_0 v_{02} + R_1 v_{12} + R_2 u_2 + R_3 v_{32} + R_4 v_{42}$$

$$C_3(t) = C_3(t - 1) + R_0 v_{03} + R_1 v_{13} + R_2 v_{23} + R_3 u_3 + R_4 v_{43}$$

$$C_4(t) = C_4(t - 1) + R_0 v_{04} + R_1 v_{14} + R_2 v_{24} + R_3 v_{34} + R_4 u_4$$

Where R_i is the number cells of type $i = 0, \dots, 4$ in a neighbourhood and u_i is the influence that a particular group has upon themselves

RULES

- **Update of a susceptible:**
 - a) a susceptible dies after τ_1 time steps.
 - b) if $C_1 \leq -1$ then the susceptible becomes an IDU.
- **Update of an IDU:**
 - a) an IDU dies after τ_2 time steps.
 - b) for each IDU-HIV in its neighbourhood the IDU has probability p of contracting the HIV virus and becoming an IDU-HIV for each contaminated needle shared. If the HIV-IDU neighbour was infected ≤ 2 or ≥ 84 months ago, p is 0.5, otherwise p is 0.001.
 - c) if the IDU does not contract HIV and $C_2 \geq 1$ then the IDU becomes a susceptible.
- **Update of an IDU-HIV:**
 - a) an IDU-HIV dies after carrying the disease for τ_3 time steps.
 - b) if the IDU-HIV does not die and $C_3 \geq 1$ then the IDU-HIV becomes an HIV.
- **Update of an HIV:**
 - a) an HIV dies after carrying the disease for τ_4 time steps.
 - b) if the HIV does not die and $C_4 \leq -1$ then the HIV becomes an IDU-HIV.

RULES

- **Update of a susceptible:**
 - a) a susceptible dies after τ_1 time steps.
 - b) if $C_1 \leq -1$ then the susceptible becomes an IDU.
- **Update of an IDU:**
 - a) an IDU dies after τ_2 time steps.
 - b) for each IDU-HIV in its neighbourhood the IDU has probability p of contracting the HIV virus and becoming an IDU-HIV for each contaminated needle shared. If the HIV-IDU neighbour was infected ≤ 2 or ≥ 84 months ago, p is 0.5, otherwise p is 0.001.
 - c) if the IDU does not contract HIV and $C_2 \geq 1$ then the IDU becomes a susceptible.
- **Update of an IDU-HIV:**
 - a) an IDU-HIV dies after carrying the disease for τ_3 time steps.
 - b) if the IDU-HIV does not die and $C_3 \geq 1$ then the IDU-HIV becomes an HIV.
- **Update of an HIV:**
 - a) an HIV dies after carrying the disease for τ_4 time steps.
 - b) if the HIV does not die and $C_4 \leq -1$ then the HIV becomes an IDU-HIV.

A large, stylized red ribbon graphic is positioned on the left side of the slide, partially overlapping the text. It is a solid red color and has a thick, flowing appearance.

Modelling Scenarios

1. **No Social Influence Scenario**

HIV transmission depends only on initial numbers of IDU, IDU-HIV and transmission probability.

2. **Peer Pressure Scenario**

IDU and IDU-HIV exert peer pressure on everyone to use drugs (and share needles), while Stayers exert strong pressure on all to discontinue drug use. Susceptibles and HIV exert a weak positive influence on everyone.

3. **Pessimistic Scenario**

HIV and IDU-HIV exert pressure on everyone to use drugs, while Stayers discourage everyone from using drugs. In this case Susceptibles and HIV exert a weak negative influence (Auld, 2003)

Parameters Estimation

Parameters	Variation Range
% of IDUs sharing needles	20 - 40
# of sharing needles per day	0.03 - 0.06
Life expectancy for IDU-HIV and HIV	4 - 8 years

Social Interactions

Agents	No Influence	Peer Pressure	Pessimistic
0 (Stayers)	0	1/30	1/30
1 (Susceptible)	0	1/300	-1/300
2 (IDU)	0	-1/150	-1/150
3 (IDU-HIV)	0	-1/150	-1/150
4 (HIV)	0	1/300	-1/300

3. Why use a CA model?
4. The Model
5. Modelling Scenarios
6. Results
7. Assumptions and Limitations
8. Conclusions
9. Future Work

Assumptions and Limitations

- Homogeneity of the population regarding risk behaviour
- Constant population size
- No distinction made between drug use and needle-sharing behaviour

Outline

1. Definition of the Problem
2. The Vancouver Downtown Eastside
3. Why use a CA model?
4. The Model
5. Modelling Scenarios
6. Results
7. Assumptions and Limitations
8. **Conclusions**
9. Future Work

Conclusions

- Without social influence, epidemic is stable
- With social influence, increase in number of HIV infections
- Pessimistic attitudes had a stronger effect than peer pressure

Outline

1. Definition of the Problem
2. The Vancouver Downtown Eastside
3. Why use a CA model?
4. The Model
5. Modelling Scenarios
6. Results
7. Assumptions and Limitations
8. Conclusions
9. Future Work

Future Work

- Calibrate model to data from DTES and other settings
- Incorporate needle-sharing behaviour at the micro level
- Incorporate concurrent risky IDU and sexual behaviour
- Incorporate spatial landmarks
