Investigating Middle Atmospheric Chemistry at the Polar Environment Atmospheric Research Laboratory

Kimberly Strong Department of Physics, University of Toronto

Co-Investigators: J. Drummond, H. Fast, A. Manson, T. McElroy, G. Shepherd, R. Sica, J. Sloan, K. Strawbridge, K. Walker, W. Ward, J. Whiteway
Collaborators: J. McConnell, P. Bernath, T. Shepherd
Students: A. Fraser, D. Fu, F. Kolonjari, R. Lindenmaier, H. Popova
Post-docs: R. Batchelor, T. Kerzenmacher, K. Sung
Env. Canada: M. Harwood, R. Mittermeier
CANDAC: P. Fogal, A. Harrett, A. Khmel, C. Midwinter, P. Loewen, O. Mikhailov, M. Okraszewski

SPARC DA / IPY Workshop

Toronto, 4-7 September 2007

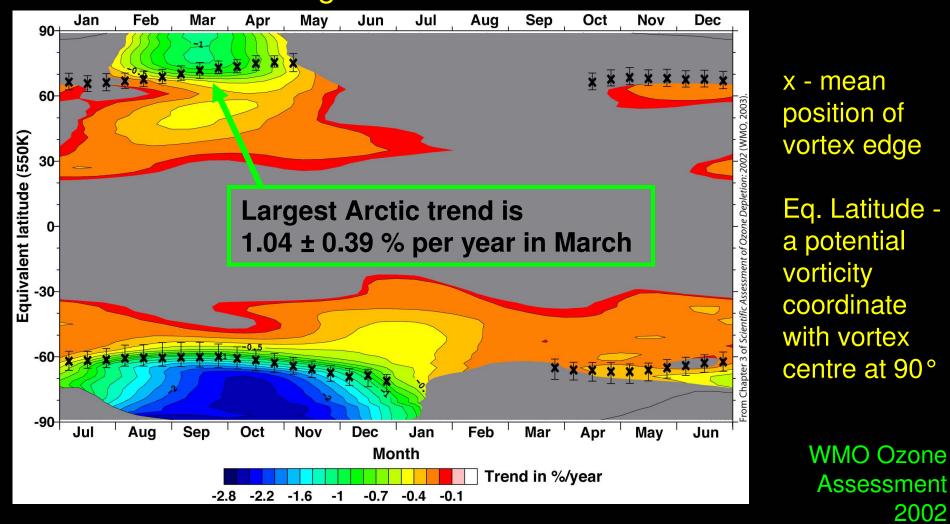

Overview

- Polar Stratospheric Ozone Trends
- The Need for Arctic Measurements
- The PEARL at Eureka
- The Arctic Middle Atmosphere Chemistry Theme
- Measurements: Initial and Historical
- Outlook

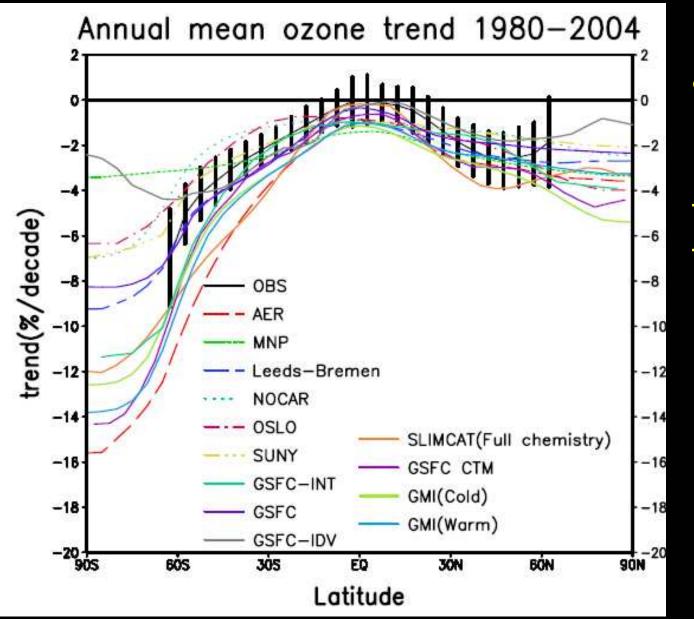

Seasonal Total Ozone Trends

Total ozone column trends as a function of equivalent latitude and season using TOMS and GOME data for 1978-2000

Latitudinal Total Ozone Trends

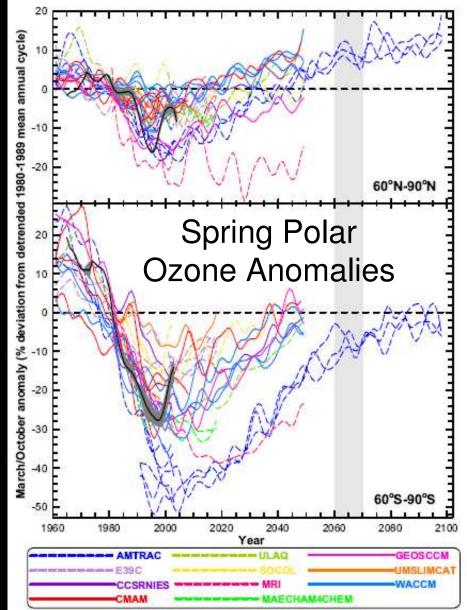

Measured and modelled latitudinal total ozone trends

> WMO Ozone Assessment 2006

Polar Ozone - Predictions

Gradual recovery of ozone is anticipated as stratospheric chlorine decreases

- \rightarrow Ozone turnaround in the Arctic is likely before 2020
- → Vunerable to perturbations, such as aerosols from volcanoes
- → Coupled to stratospheric cooling
- → Extreme Arctic ozone loss is not predicted

The Need for Arctic Measurements

"... the frequency of measurements deep in the Arctic vortex remains low. The situation is unsatisfactory given the highly non-linear sensitivity of Arctic stratospheric ozone to cold winters. ... Chemical and dynamical perturbations caused by strong volcanic eruptions make it impossible to derive a linear trend [in total ozone], which highlights the importance of continuous measurements throughout the expected recovery of the ozone layer during the coming decades."

The Need for Arctic Measurements

"With regard to the Arctic, the future evolution of ozone is potentially sensitive to climate change and to natural variability, and will not necessarily follow strictly the chlorine loading. There is uncertainty in even the sign of the dynamical feedback to WMGHG changes. ... Progress will result from further development of CCMs [chemistry-climate models] and from comparisons of results between models and with observations."

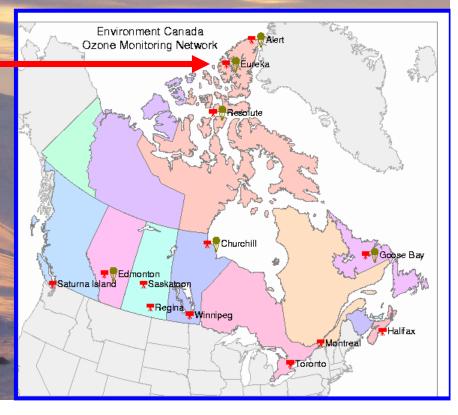

> IPCC/TEAP 2005, Special Report on Safeguarding the Ozone Layer and the Global Climate System

The PEARL at Eureka

- **Polar Environment Atmospheric Research Laboratory**
 - → Formerly Environment Canada's Arctic Stratospheric Ozone Observatory
 - Now run by the Canadian Network for Detection of Atmospheric Change (CANDAC)
 - ightarrow Began operating in August 2005

Located on Ellesmere Island in Nunavut, 15 km from the Eureka Weather Station (80 °N, 86 °W)

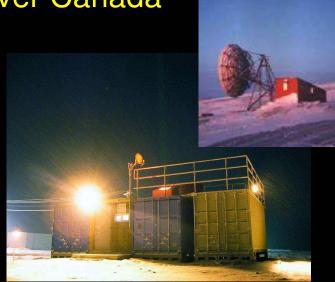

Canadian Network for Detection of Atmospheric Change

- Network of university and government researchers dedicated to studying the changing atmosphere over Canada
- Initial emphasis is on the Arctic
 - \rightarrow PEARL is the first CANDAC site
- CANDAC facilities at Eureka
 - \rightarrow Three labs: PEARL, ØPAL, and SAFIRE
 - \rightarrow Dedicated C-band satellite link
- Future goals include

- \rightarrow Coordinating research-level atmospheric measurements
- \rightarrow Integrating satellite, aircraft, balloon, ground-based measurements
- \rightarrow Developing quality control protocols for these data
- \rightarrow Establishing "anchor sites" in different regions

PEARL Objectives

- To measure the atmosphere in the range 0-100 km as comprehensively as possible
 - \rightarrow stratospheric ozone, climate change, air quality
- To deploy research-grade equipment
- To develop new instrumentation and observing strategies
- To provide a Canadian research presence at this remote location
 - \rightarrow 1,100 km from the North Pole

PEARL Research Themes

- PEARL research is divided into four themes:
 - \rightarrow Arctic Troposphere Transport and Air Quality
 - \rightarrow The Arctic Radiative Environment
 - * Impacts of Clouds, Aerosols and Diamond Dust
 - \rightarrow Middle Atmospheric Chemistry in the Arctic
 - $\rightarrow\,$ Waves and Coupling Processes
- Other significant research activities
 - \rightarrow Satellite Validation
 - \rightarrow Sudden Events

Instruments

PEARL

- Stratospheric Ozone Lidar
- DA8 FTS/ 125HR FTS
- Aerosol Mass Spectrometer
- <u>UV-Vis Spectrometer</u>
- Michelson E-Region Wind Interferometer (ERWIN)
- Spectral Imaging Interferometer (SATI)
- All Sky Imager
- Sun Photometer
- Brewer Spectrophotometer

ØPAL

- Millimeter Cloud Radar
- High Spectral Resolution Lidar (SEARCH)
- VHF Meteor Radar
- Polar Atmospheric Emitted Radiance Interferometer (P-AERI)
- Sun and Star Photometer
- Tropospheric Ozone Lidar
- Rayleigh/Mie/Raman Lidar

SAFIRE

- WindTracker Radar
- Baseline Surface Radiation Network Instrumentation
- Flux Tower

Arctic Middle Atmosphere Chemistry Theme

Science Questions

- What is the chemical composition of the Arctic stratosphere above PEARL?
 - \rightarrow How and why is it changing with time?
- How is the chemistry coupled to dynamics, microphysics, and radiation?
- What is the polar stratospheric bromine budget?
 - \rightarrow Significant source of uncertainty
 - \rightarrow BrO + CIO cycle estimated to contribute up to half chemical loss
- How will the polar stratosphere respond to climate perturbations?
 - \rightarrow Particularly while CI and Br loading is high
 - \rightarrow How will changes in atmospheric circulation affect polar ozone?
 - \rightarrow Cooling (more ozone depletion) or warming (less)?

Arctic Middle Atmosphere Chemistry Theme

Primary Composition Instruments

- Bruker 125HR Fourier transform infrared spectrometer (FTS) \rightarrow Direct solar (and lunar) absorption, 700-4500 cm⁻¹ at high resolution
- UV-visible grating spectrometer
 - \rightarrow Zenith-scattered (and direct) solar absorption, 300-600 nm
- Stratospheric ozone lidar \rightarrow Differential Absorption Lidar (DIAL)
- Brewer spectrophotometer \rightarrow Ozone total columns
- Polar Atmospheric Emitted Radiance Interferometer (P-AERI) \rightarrow Emission, 400-3300 cm⁻¹ (3-25 µm) at low spectral resolution

Measurements

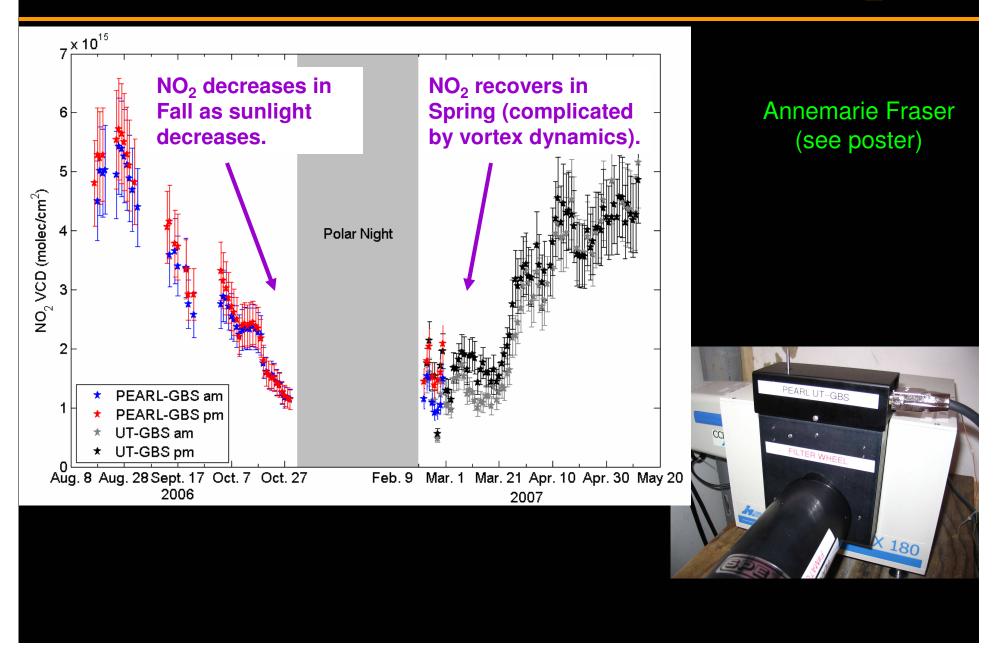

- Reactive species, source gases, reservoirs, dynamical tracers $\rightarrow O_3$, NO, NO₂, HNO₃, N₂O₅, NO₃, N₂O, CIONO₂, HCI, OCIO, BrO, HF, CFCs, CH₄, H₂O, CO, OCS, ...
- Total columns and some information on vertical distribution

2006-2007 AMAC Highlights

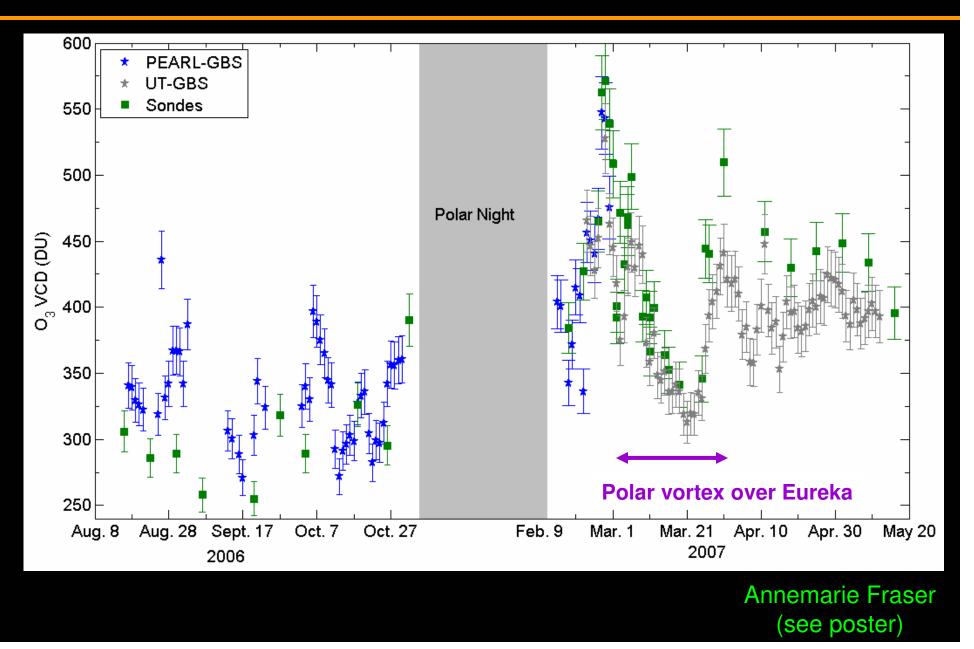

- February-March 2006 ACE Arctic validation campaign
- March 2006 installation of SEARCH / U of Idaho AERI
- July 2006 installation of new Bruker IFS 125HR FTS
- August 2006 installation of new UV-visible grating spectrometer
- August-October 2006 first data from both instruments
- February-March 2007 ACE Arctic validation campaign
- July 2007 Bruker / Bomem intercomparison campaign
- August-September 2007 NDACC Aura validation campaign
- Ongoing daily measurements, implementation and optimization of retrieval algorithms, initial analysis

See posters by Rebecca Batchelor and Annemarie Fraser.

Existing Bomem DA8

New Bruker 125HR

Analysis of DA8 FTS Archive

Bomem DA8 FTS

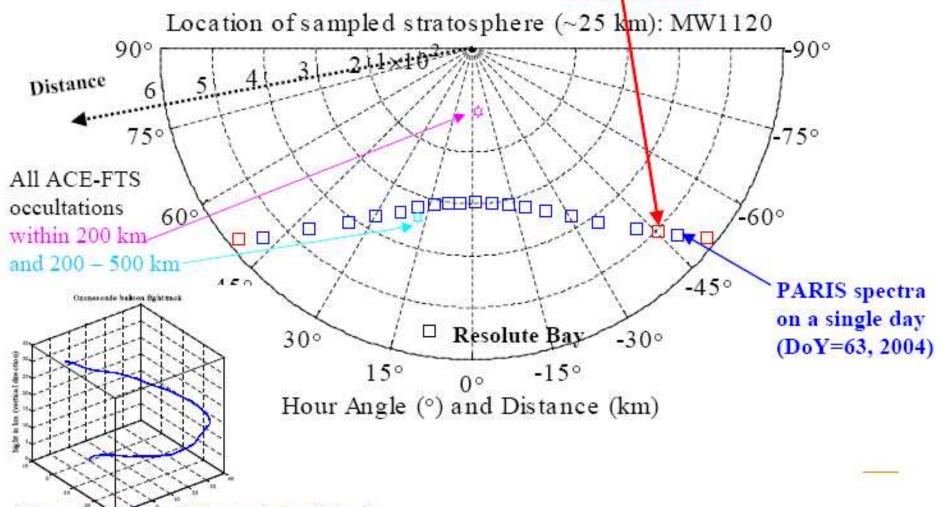

- \rightarrow Installed at Eureka (AStrO) in 1993
- \rightarrow Operated by EC (Hans Fast, Richard Mittermeier)
- \rightarrow NDACC Arctic Primary Station instrument

- Goal: To reanalyse the full DA8 data set (1993-2007) using a consistent approach (SFIT-2) to retrieve total column amounts, partial columns, and vertical mixing ratio profiles
 - $\rightarrow\,$ Daily p and T profiles from $\,$ radiosondes, NCEP, MSIS $\,$
 - \rightarrow A priori volume mixing ratio profiles and covariances from ozonesonde archive, HALOE, SPARC 2000
 - $\rightarrow\,$ Spectral fitting regions based on ACE-FTS v2.2 and prior values
- Initial focus on analysis of 2004-2006 data
 - \rightarrow O₃, NO, NO₂, HNO₃, HF, HCI, CIONO₂, CH₄, N₂O
 - \rightarrow Averaging kernels, degree of freedom for signal, and error budgets

Geographic distribution of atmospheric samplings (relative to the observation site, **Eureka on Mar. 3, 2004**)

Outlook

- Long-term measurements are essential to understanding the chemical state of the Arctic stratosphere and how it is changing with time
 - \rightarrow Focus of the <u>Arctic Middle Atmosphere Chemistry theme</u> at PEARL
- Instruments currently installed are operating well
 - $\rightarrow\,$ NDACC certification for Bruker FTS and UV-visible spectrometer
- Some installation and upgrades to be done
 - $\rightarrow\,$ Installation of new sun-trackers for FTS and UV-visible spectrometer
 - \rightarrow Automation of Bruker FTS measurements
 - ightarrow Upgrade and operation of stratospheric ozone lidar
 - \rightarrow Installation of CANDAC P-AERI
- Integration with complementary measurements at PEARL
- Contributions to IPY atmospheric science

CANDAC / PEARL Co-Investigators

Principal Investigator

• Prof. James R. Drummond, Dalhousie University / University of Toronto

CANDAC Manager of Operations

• Dr. Pierre Fogal, University of Toronto

Theme Leaders

- Prof. Tom Duck, Dalhousie University, The Arctic Radiative Environment: Impacts of Clouds, Aerosols, and "Diamond Dust"
- Prof. Jim Sloan, University of Waterloo, Arctic Tropospheric Transport and Air Quality,
- Prof. Kimberly Strong, University of Toronto, Arctic Middle Atmospheric Chemistry
- Prof. William Ward, University of New Brunswick, Waves and Coupling Processes

Co-Investigators

- Dr. Stephen Argall, University of Western Ontario
- Dr. Hans Fast, Environment Canada
- Dr. David Hudak, Environment Canada
- Prof. Alan Manson, University of Saskatchewan
- Dr. Bruce McArthur, Environment Canada
- Dr. Tom McElroy, Environment Canada
- Prof. Norman O'Neill, Université de Sherbrooke
- Prof. Marianna Shepherd, York University
- Prof. Gordon Shepherd, York University
- Prof. Robert Sica, University of Western Ontario
- Dr. Kevin Strawbridge, Environment Canada
- Prof. Kaley Walker, University of Toronto
- Prof. Jim Whiteway, York University

The following organizations are involved in supporting CANDAC / PEARL: CFCAS, CFI, CSA, EC, MRI, MSC, NSERC, NSIRT, OIT, PCSP, SEARCH
