Workshop on arithmetic geometry

1 Lefschetz theorems

2 Lcf and G3 on arithmetic surfaces

joint work with A. Elkik

3 Lef on arithmetic three-folds

work in progress

Lefschetz's version

1924 d'analysis situs et la géométrie algébrique

$V_n \hookrightarrow \mathbb{P}^n$ smooth projective complex variety

$H \hookrightarrow \mathbb{P}^n$ hyperplane

$$i \leq n-1 \Rightarrow H_i(V_n, V_n \cap H) = 0$$

i.e.

$$H_i(V_n \cap H) \xrightarrow{\quad} H_i(V) \quad \begin{aligned} &\text{if } i < n-1 \\ &\xrightarrow{\quad} \text{if } i = n-1 \end{aligned}$$

Precursors

?

"Berkini" V_n projective irreducible

?
 $n \geq e \Rightarrow V_n \cap H$ connected

Picard

1889

$$H_1(V_n \cap H) \rightarrow H_1(V)$$

Gastelnuovo - Enriques

1906

$$H_1(V_n \cap H) \cong H_1(V_n) \quad \text{if } n \geq 3$$

Further developments over \mathbb{C}

- π_i instead of H_i \leftarrow Morse theory
- singular spaces

Gromov, Bott, Andreotti - Frankel

"SGA 2"

cohomological methods : formal geometry and
duality

The conditions Lef and Lef^f

X algebraic variety / scheme over \mathbb{R}

Y $\hookrightarrow X$

$\hat{X} :=$ formal completion of X along Y
 $= \varprojlim X_n$

if \mathcal{F} is a coherent sheaf over a neighborhood of Y ,
then $\widehat{\mathcal{F}}$ denotes its "restriction" $\varprojlim \mathcal{F}_{|Y_n}$ to \hat{X} .

Lef(X, Y) Lefschetz condition

| For any vector bundle E over an open nbhd U of Y in X ,

$$\Gamma(U, E) \xrightarrow{\sim} \Gamma(\hat{X}, \hat{E})$$

Lef^f(X, Y) condition de Lefschetz effective

| Any vector bundle E^{for} over \hat{X} "extends"
to a vector bundle E over some open nbhd U of Y in X

[i.e. there exists $U \dots, E$ locally free
coherent sheaf over U , and an isom.
 $\hat{E} \cong E^{\text{for}}$ of $\mathcal{O}_{\hat{X}}$ -modules over Y]

Theorem (SGA 2, exposé XII, in a simple case)

- X smooth projective variety over \mathbb{R}
- Y ample hypersurface in X
 - [i.e. hyperplane section of X for some projective embedding]
- $\dim X \geq 2 \Rightarrow \text{Lef}(X, Y)$
- $\dim X \geq 3 \Rightarrow \text{Lef}^{\text{tf}}(X, Y)$

Comments :

1) actual version in SGA 2:

relative version, under weaker regularity hypotheses; namely

$$\begin{array}{ccc} Y & \hookrightarrow & X \\ \downarrow & & \downarrow \pi \text{ proper} \\ S & = & S \end{array}$$

with Y (relative) Cartier divisor, ample relative to π , and similar assumptions on the dimension/depth of the fibers of π .

e) local versions

idea :

$$Y \hookrightarrow X \hookrightarrow \mathbb{P}^n$$

or

$$0 \in CY \hookrightarrow CX \hookrightarrow A^{n+1}$$

vector bundle over X

"homogeneous" vector bundle over $CX \setminus 0$

is natural to investigate L_{ef} and L_{eff} for

$$CY \setminus \{0\} \leftrightarrow CX \setminus \{0\}$$

and more generally

$$(f = 0) \setminus \{m_A\} \hookrightarrow \text{Spec } A \setminus \{m_A\}$$

A noetherian local ring

cf. SGA 2, exposé IX

- extended notably by

M.-e Raynaud. Ann. Sci. ENS \cong 1974

G. Faltings. Ann. of Math. \cong 1979

3) geometric applications

ample hypersurface

$$Y \hookrightarrow \hat{X} \hookrightarrow X$$

smooth, projective over
dimension d

π_0

$$\simeq \quad \simeq \iff \text{Lef}(x, y) \quad d \geq 2$$

π_1^{et}

$$\simeq \quad \longrightarrow \iff \text{Lef}(x, y) \quad d \geq 2$$

π_1^{et}

$$\simeq \quad \simeq \iff \text{Lef}(x, y) \quad d \geq 3$$

$$\text{Pic} \quad \forall i > 0, H^i(Y, N^{v \otimes i}) = 0 \iff \longleftrightarrow \iff \text{Lef}(x, y) \quad d \geq 3 \quad \left. \begin{array}{l} R = \mathbb{C} \\ Y \text{ sm.} \end{array} \right\}$$

$$\text{Pic} \quad \forall i > 0, H^i(Y, N^{v \otimes i}) = 0 \quad \simeq \quad \simeq \iff \text{Lef}(x, y) \quad d \geq 4 \quad \left. \begin{array}{l} R = \mathbb{C} \\ Y \text{ sm.} \end{array} \right\}$$

$$N := N_Y|_X \simeq \mathcal{O}(Y)|_Y \quad \text{ample line bundle over } Y$$

$$\text{Pic} := \{ \text{line bundles / iso.} \}$$

4) Related work in Hironaka - Matsumura,
 J. Math. Soc. Japan 20, 1968

$$\begin{array}{c}
 \text{irreducible variety over } k \\
 Y \hookrightarrow \hat{X} \hookrightarrow X \\
 k(\hat{X}) \xleftarrow{\text{ii}} k(X) \\
 \text{formal rational functions on } \hat{X} \qquad \text{rational functions on } X \\
 Y \text{ is G3 in } X \iff k(\hat{X}) = k(X)
 \end{array}$$

Examples of G3 embeddings:

- $Y \hookrightarrow \mathbb{P}^n \quad \dim Y > 0$
- $Y_1 \hookrightarrow X_e$
 ample curve projective surface
- over \mathbb{C} , relation with pseudoconcavity

Hartshorne, Gieseker

Ehres, Faltings

Lefschetz theorems on arithmetic schemes?

$$\begin{array}{ccc}
 Y & \hookrightarrow & X \\
 \downarrow & f & \\
 X \cap \mathbb{P}_\mathbb{Z}^{N-1} & & \mathbb{P}_\mathbb{Z}^N
 \end{array}
 \quad \text{projective flat schemes over } \mathbb{Z}; \quad X \text{ regular}$$

hyperplane section

SGA 2

$\text{Lef}(X, Y)$ holds when $\dim X_\mathbb{Q} \geq 2$

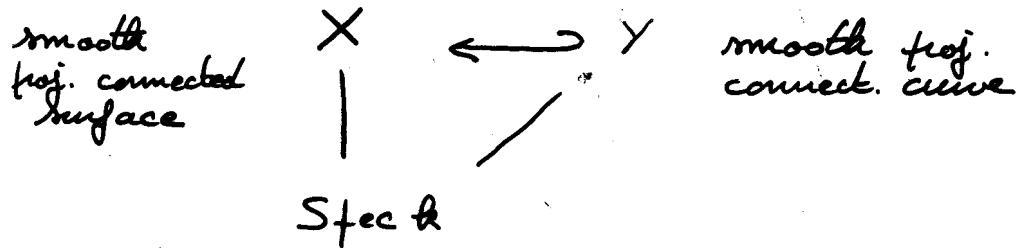

$\text{Lef}^f(X, Y)$ " " $\dim X_\mathbb{Q} \geq 3$

analogy "number fields - function fields"
 "Arakelov's philosophy"

arithmetic analogue $\text{Lef}(X, Y)$ when $\dim X_\mathbb{C}$,
 involving complex analysis/geometry of
 of $Y(\mathbb{C}) \hookrightarrow X(\mathbb{C})$ $\text{Lef}^f(X, Y)$ when $\dim X_\mathbb{C}$.

Lef and G3 on arithmetic surfaces

Geometric case

$$\text{HGeo} \quad Y \cdot Y = \deg_Y N_Y X > 0$$

"big and nef"

$\Rightarrow \exists$ finite family $(C_i)_{i \in I}$ of projective curves in X s.t. $C_i \cap Y = \emptyset$

$$U := X \setminus \bigcup_{i \in I} C_i$$

$$\hat{X} := \varinjlim_m Y_m ; \text{ } E \text{ v. b. on } X, \hat{E} := \varprojlim E,$$

Thm (Grothendieck, Hartshorne, Hironaka - Matsumura ...)

When HGeo holds,

$$k(X) \xrightarrow{\sim} k(\hat{X});$$

for any vector bundle E over U ,

$$\Gamma(U, E) \xrightarrow{\sim} \Gamma(\hat{X}, \hat{E})$$

Arithmetic counterpart

data : $\begin{array}{ccc} Y & \hookrightarrow & X \\ & \searrow \sim & \downarrow \pi \\ & & \text{Spec } O_K \end{array}$

projective regular
integral arithmetic
surface

for any $\sigma : K \hookrightarrow \mathbb{C}$,

$$y_\sigma \in \Omega_\sigma \hookrightarrow X_\sigma(\mathbb{C})$$

such that $\Omega_{\bar{\sigma}} = \Omega_\sigma^{\text{c.c.}}$

$g_{y_\sigma, \Omega_\sigma}$ Green function of y_σ in Ω_σ :

- $g_{y_\sigma, \Omega_\sigma}$ harmonic on $\Omega_\sigma \setminus \{y_\sigma\}$;
vanishes "on" $\partial \Omega_\sigma$
- $g_{y_\sigma, \Omega_\sigma} = \log |\beta - \beta(y_\sigma)|^{-1} + \sigma$
 $+ O(|\beta - \beta(y_\sigma)|)$

II. $\| \cdot \|_{y_\sigma, \Omega_\sigma}^{\text{cap}}$ norm on $T_{y_\sigma} X_\sigma$:

$$\left\| \frac{\partial}{\partial \beta} \right\|_{y_\sigma, \Omega_\sigma}^{\text{cap}} := e^{-\sigma}$$

HAn

$$\deg_Y (N_{Y/X} (\|\cdot\|_{y_\sigma, \Omega_\sigma}^{\text{cap}})) > 0$$

HAr

↓ Feilrete, Szegő, ..., Ramanujan ...

∃ finite family $(C_i)_{i \in I}$ of 1-dimensional closed integral subschemes s.t. $C_i \cap Y = \emptyset$
 $C_{i,\sigma} \cap \Omega_\sigma = \emptyset$

$$\mathcal{U} := \mathcal{X} \setminus \bigcup_{i \in I} C_i$$

Theorem (A. Chambert-Loir + JBB)

When HAr holds,

$\mathcal{X}(\mathcal{X}) \simeq \left\{ f \in \Gamma(Y, \text{Frac } \mathcal{O}_{\hat{\mathcal{X}}_Y}) \mid \begin{array}{l} \text{for any } \sigma: K \hookrightarrow \mathbb{C}, \\ f \text{ is meromorphic on } \Omega_\sigma \end{array} \right.$

for any vector bundle E over \mathcal{U} ,

$$\Gamma(\mathcal{U}, E) \simeq \left\{ s \in \Gamma(\hat{\mathcal{X}}, \hat{E}) \mid \begin{array}{l} \text{for any } \sigma: K \hookrightarrow \mathbb{C}, \\ s_\sigma \text{ holomorphic...} \\ \text{section of } E_\sigma \text{ over } \Omega_\sigma \end{array} \right]$$

Comments

1) Basic example

$$\begin{array}{ccc}
 0 & \hookrightarrow & \mathbb{P}'_{\mathbb{Z}} \\
 & \searrow & \downarrow \\
 & & \text{Spec } \mathbb{Z}
 \end{array}
 \quad
 \begin{aligned}
 \Omega &:= \mathcal{D}(0, R) \\
 g_{0, \Omega} &= \log^+ \frac{R}{|z|} \\
 \left\| \frac{\partial}{\partial z} \right\|_{0, \Omega}^{\text{cap}} &= \frac{1}{R}
 \end{aligned}$$

$$\deg(N_0 \mathbb{P}'_{\mathbb{Z}}, \|\cdot\|_{0, \Omega}^{\text{cap}}) = \log R$$

$$\text{HAr} \iff R > 1 \quad \mathcal{U} = \mathbb{A}'_{\mathbb{Z}}$$

Borel's theorem:

$$f \in \mathbb{Z}[[x]] \text{ meromorphic on } \mathcal{D}(0, R), R > 1$$

$$\Rightarrow f \in \mathbb{Q}(x)$$

2) Established by using

- (i) Diophantine approximation techniques, and
- (ii) Hodge Index Theorem (Faltings-Hilbert) on arithmetic surfaces.

Admits more general versions, involving p -adic rigid analytic geometry. cf. "Manin Festschrift"

Applications to p -adic and classical modular forms

3) Application to π_1 , extending earlier work of Ihara

$$y \hookrightarrow \mathcal{X} \xrightarrow{\sim} \text{Spec } \mathbb{Z}$$

$y_c \in \Omega = \Omega^{\text{c.c.}} \hookrightarrow \mathcal{X}(C)$

$$\text{HAr} \Rightarrow \hat{\pi}_1(\Omega, x) \longrightarrow \pi_1(\mathcal{X}, x)$$

Lef. + H. (Iwahori)

$$\pi_1(U, x)$$

Example : $\pi_1(y^2 + y = x^{q+1}) = \{0\}$
 (variant)

$$\mathbb{A}^2_{\mathbb{Z}}$$

c. JBB Ann. Sc. ENS 32 1999

3 Lefschetz arithmetic 3-folds

Data :

X integral regular projective scheme
 \uparrow over $\text{Spec } \mathbb{Z}$, s.t. $\dim X = 3$

Y smooth divisor in X

$Y(\mathbb{C}) \hookrightarrow \Omega \hookrightarrow X(\mathbb{C})$ analytic open subset
 invariant under c.c.

may define a ringed topos $(\tilde{X}, \tilde{\mathcal{O}})$, designed
 to deal with the "combination" of formal geometry
 on $\hat{X} := \varinjlim Y_n$ and analytic geometry on $X(\mathbb{C})$:

Grothendieck topology

$$\tilde{U} := (V, U^{\text{an}}) \quad \text{s.t. } U^{\text{an}} \cap Y(\mathbb{C}) = V \cap Y$$

$\xrightarrow{\text{continuous}}$ $\xrightarrow{\text{analytic}}$
 V $X(\mathbb{C})$

...

sheaf of rings

$$\tilde{\mathcal{O}}(\tilde{U}) = \{(\hat{s}, s^{\text{an}}) \in \hat{\mathcal{O}}(V) \times \mathcal{O}^{\text{an}}(U^{\text{an}}) \mid \hat{s}_c = \widehat{s^{\text{an}}} \text{ on } X(\mathbb{C})_c\}$$

Example : vector bundle on $\tilde{X} :=$ locally free sheaf of $\mathcal{O}_{\tilde{X}}$ -
 - module of finite rank

$$\tilde{E} \longleftrightarrow (\hat{E}, E^{\text{an}}, \varphi) \quad \dots \hat{E} \sim E^{\text{an}}$$

"Conjecture"

Assume that there exists

$$\begin{aligned}\bar{\mathcal{L}} &:= (\mathcal{L}, \|\cdot\|) \text{ hermitian line bundle on } \mathcal{X} \\ s &\in \Gamma(\mathcal{X}, \mathcal{L}) \setminus \{0\}\end{aligned}$$

such that

$$\bar{\mathcal{L}} \text{ is nef} \quad h_{\bar{\mathcal{L}}} \geq 0$$

$$\bar{\mathcal{L}} \text{ is relatively positive } \mathcal{L} \text{ ample, } c_1(\bar{\mathcal{L}}) > 0$$

$$y = \operatorname{div} s$$

$$\|s\| \leq 1 \text{ on } \mathcal{X}(\mathbb{C})$$

$$\Omega = \{x \in \mathcal{X}(\mathbb{C}) \mid \|s(x)\| < 1\}.$$

Then any vector bundle $\tilde{\mathcal{E}}$ over $\tilde{\mathcal{X}}$
is algebraizable.

namely : it is the "restriction" of a vector
bundle \mathcal{E} on $\mathcal{X} \setminus F$, for some
finite set F of closed points in \mathcal{X} ;
 $F = \emptyset$ when $\operatorname{rk} \mathcal{E} = 1$

" . " : OK modulo a "conjecture"
in Kosarew - Peternell Compositio M (1990)

Comments

1) Basic example

$$\mathbb{P}_{\mathbb{Z}}^1 \hookrightarrow \mathbb{P}_{\mathbb{Z}}^2 \quad \Sigma_R := \{(x_0 : x_1 : x_2) \in \mathbb{P}^2(\mathbb{C}) \\ \text{ s.t. } |x_2|^2 < R^2(|x_0|^2 + |x_1|^2)\}$$

with $R > 1$

N. B. : $\text{Pic}(\hat{\mathbb{P}}_{\mathbb{Z}}^2, \hat{\mathcal{O}})$ "huge" groups
 $\text{Pic}(\Sigma_R, \mathcal{O}^{\text{an}})$

2) Toy model for "arithmetic algebraization theorems" concerning, say, line bundles.
 Actually, here also, more sophisticated variants involving p -adic rigid geometry at finite places.

Motivation : Conjecture of Ogas LNM 300

X smooth projective variety over a number field K

$$c_* : CH^*(X)_\mathbb{Q} \longrightarrow H_{\text{dR}}^*(X/K)$$

For almost every \wp , $H_{\text{dR}}^*(X/K) \otimes K_\wp$ is equipped with the crystalline Frobenius Φ_\wp

$$c_*(CH^*(X)_\mathbb{Q}) \subset \{\alpha \in H_{\text{dR}}^*(X/K) \mid \forall \wp, \Phi_\wp \alpha = \alpha\}$$

3) Applications to π_1

$$\text{“} \pi_1(y) *_{\pi_1(y_c)} \hat{\pi}_1(-2) \text{”} \simeq \pi_1(\infty)$$

“ . ” : take care of base points
and complex conjugation

$$h_{\mathcal{O}}^i(\bar{E})$$

\bar{E} := hermitian vector bundle over $\text{Spec } \mathbb{Z}$
 a. h. a. -euclidean lattice

$$\dim_{\mathbb{F}_1} \Gamma(\overline{\text{Spec } \mathbb{Z}}, \bar{E}) = ??$$

$$h^0(\bar{E}) := \log \# \{ v \in E \mid \|v\| \leq 1 \}$$

see e.g. Gillet, Soulé Israel J.M.
~~74~~ 1991

$$h_{\mathcal{O}}^0(\bar{E}) := \log \sum_{v \in E} e^{-\pi \|v\|^2}$$

Rössler 1993
 van der Geer - Schoof
 2000

Motivations

i) "Riemann - Roch = Poisson"

functional equation : Hecke, F. K. Schmidt, Tate

$$h_{\mathcal{O}}^1(\bar{E}) := h_{\mathcal{O}}^0(\bar{E}^\vee)$$

$$h_{\mathcal{O}}^0(\bar{E}) - h_{\mathcal{O}}^1(\bar{E}) = \deg \bar{E}$$

More generally, for any number field K
 and any hermitian vector $\bar{E} = (E; (\|.\|_\sigma))_{\sigma: K \rightarrow \mathbb{C}}$
 on $\text{Spec } \mathcal{O}_K$, we let

$$\pi_* \bar{E} := (E, \|.\|) \quad \|e\|^2 := \sum_{\sigma: K \rightarrow \mathbb{C}} \|e\|_\sigma^2$$

$$h_{\mathcal{O}}^i(\bar{E}) := h_{\mathcal{O}}^i(\pi_* \bar{E}), \quad i = 0, 1$$

$\bar{\omega} := (\omega, (\|\cdot\|_\omega))$ "canonical" hermitian
line bundle on $\text{Spec } \mathcal{O}_K$

$$\omega := \text{Hom}_{\mathbb{Z}}(\mathcal{O}_K, \mathbb{Z})$$

$$\|\text{tr}_{K/\mathbb{Q}}\|_\omega := 1$$

Then : $h^0_{\bar{\omega}}(\bar{E}) = h^0_{\bar{\omega}}(\bar{E}^\vee \otimes \bar{\omega})$

$$h^0_{\bar{\omega}}(\bar{E}) - h^0_{\bar{\omega}}(\bar{E}) = \deg \bar{E} - \text{rk } E \frac{1}{2} \log \Delta_K$$

ii) classical results in the theory of euclidean
lattices :

- coding cf. Conway - Sloane
- modular forms associated to integral
lattices
- geometry of numbers

Banaszczyk Math. Ann. 296 1993

Gubarev Topology 38 1999

iii)
$$\int_{\mathbb{R}^N} e^{-\pi(x_1^2 + \dots + x_N^2)} dx_1 \dots dx_N = 1$$

Facts :

$$1) \quad h^0_{\mathcal{B}}(\bar{E}) \in [0, +\infty[$$

$$2) \quad -\pi \leq h^0_{\mathcal{B}}(\bar{E}) - h^0(\bar{E}) \leq \frac{1}{2} r \log r + \log(1 - \frac{1}{e\pi})$$

$r := \operatorname{rk} E$

1) + 2) + "Riemann-Roch" \Rightarrow Minkowski

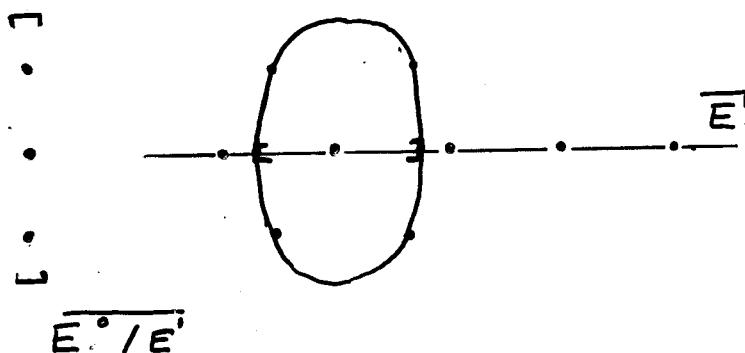

$$3) \quad \text{filtration} \quad E = E^0 \supset E' \supset \dots \supset E^n = \{0\}$$

$$h^0_{\mathcal{B}}(\bar{E}) \leq \sum_{i=1}^n h^0_{\mathcal{B}}(\overline{E^{i-1}/E^i})$$

$$\Leftarrow e^{-\pi ||x||^2} \text{ of positive type}$$

- NB : . Gillet, Mazur, Soulé Bull. LMS 23 1991
 "h⁰"; product ball, Blichfeldt
 . does not hold for h⁰

$$E = E^0 \supset E' \supset \overset{\circ}{E''} = \{0\}$$

$$h^0(\bar{E}) = \log 5; \quad h^0(\overline{E^0/E'}) = \log 3$$

Algebraization proofs

Kodaira - Spencer, GAGA (Serre)

"existence theorem in formal geometry" (Grothendieck)

basic argument :

- X smooth projective complex algebraic variety
- L analytic line bundle over X

Poincaré - Lefschetz : "L is algebraic"

Homological approach of Kodaira - Spencer

$$Y \hookrightarrow X \hookrightarrow \mathbb{P}^N \quad Y = \text{div } s \\ [\begin{matrix} \text{hyperplane} \\ \text{section} \end{matrix}] \quad \mathcal{O}(1) \quad s \in \Gamma(X, \mathcal{O}(1)) \setminus \{0\}$$

may assume $L|_Y$ algebraic

want to show $L \otimes \mathcal{O}(D)$ admits a non-zero analytic section for $D \gg 0$.

exact sequence of analytic sheaves:

$$0 \rightarrow L \otimes \mathcal{O}(D-1) \xrightarrow{\delta} L \otimes \mathcal{O}(D) \rightarrow L \otimes \mathcal{O}(D)_{|Y} \rightarrow 0$$

surjective
injective

exact at $L \otimes \mathcal{O}(D)$

$$\begin{aligned} 0 &\rightarrow H^0(X, L \otimes \mathcal{O}(D-1)) \xrightarrow{\delta} H^0(X, L \otimes \mathcal{O}(D)) \rightarrow H^0(Y, L \otimes \mathcal{O}(D)) \\ &\hookrightarrow H^1(X, L \otimes \mathcal{O}(D-1)) \xrightarrow{\delta} H^1(X, L \otimes \mathcal{O}(D)) \rightarrow H^1(Y, L \otimes \mathcal{O}(D)) \\ &= 0 \quad \text{if } D \gg 0 \end{aligned}$$

"large" if $D \gg 0$

key analytic point:

$$\dim_{\mathbb{C}} H^1(X^{\text{an}}, L \otimes \mathcal{O}(D)) < \infty$$

non increasing for $D \gg 0$

stationary " "

s'v sv " "

algebraization of $\tilde{\mathcal{E}}$ vector bundle over \tilde{X} :

$$\overline{H}^i := (H^i(\tilde{X}, \tilde{\mathcal{E}} \otimes \mathcal{O}(D)), \| \cdot \|_{L^2})$$

↑
Hodge theory
over $\Omega(\mathbb{C})$

- $H^i(\hat{X}, \hat{\mathcal{E}} \otimes \mathcal{O}(D))$ and $H^i(\Omega(\mathbb{C}), \mathcal{E}^{an} \otimes \mathcal{O}(D))$ have in general infinite rank ($\Omega(\mathbb{C})$ is pseudo-concave), but are "well behaved" (e.g. $H^i(\Omega(\mathbb{C}), \mathcal{E}^{an} \otimes \mathcal{O}(D))$ is separated)

$$\sum_{v \in H^i} e^{-\pi \|v\|_{L^2}^2} < \infty$$

in other words

$$h^*(\overline{H}^i) := \log \sum_{v \in H^i} e^{-\pi \|v\|_{L^2}^2}$$

is well defined in $[0, +\infty[$,

this plays the role of the finiteness dimensionality of $H^i(X, L \otimes \mathcal{O}(D))$ in KS's proof!
