# Opportunity Cost Techniques and Fulfillment Tie-Breaking 

## Paul Raff

Amazon.com
May 01, 2012

## Motivation

- James Q. Wilson, Ph.D.
- Broken Windows Theory
- Focus on the small, reap benefits on the big.

- Randomized experiment ${ }^{1}$ in Lowell, MA resulted in a statistically significant $20 \%$ drop in police calls for service.

## Motivation

Focusing on an easily-manageable subset of the system can yield enormous benefits for the system as a whole.

United States of America

United States of America

## Overview: Amazon’s Systems

(a very small slice)

## The Core Problem

| Location | Inventory | Cost: Super-saver <br> to Seattle | Cost: Second-day to <br> Seattle |
| :---: | :---: | :---: | :---: |
| PA | 50 | 4.12 | 14.12 |
| IN | 1 | 3.87 | 6.12 |
| SC | 12 | 4.41 | 15.09 |
| TN | 15 | 4.89 | 11.51 |

- Our costs are determined by the order in which orders are placed.
- Necessary at our scale.

## The Core Problem

| Location | Inventory | Cost: Super-saver <br> to Seattle | Cost: Second-day to <br> Seattle |
| :---: | :---: | :---: | :---: |
| PA | 50 | 4.12 | 14.12 |
| IN | 1 | 3.87 | 6.12 |
| SC | 12 | 4.41 | 15.09 |
| TN | 15 | 4.89 | 11.51 |

- Our costs are determined by the order in which orders are placed.
- Necessary at our scale.
- If second-day order first, then total cost would be $\$ 10.24$.

## The Core Problem

| Location | Inventory | Cost: Super-saver <br> to Seattle | Cost: Second-day to <br> Seattle |
| :---: | :---: | :---: | :---: |
| PA | 50 | 4.12 | 14.12 |
| IN | 1 | 3.87 | 6.12 |
| SC | 12 | 4.41 | 15.09 |
| TN | 15 | 4.89 | 11.51 |

- Our costs are determined by the order in which orders are placed.
- Necessary at our scale.
- If second-day order first, then total cost would be $\$ 10.24$.
- If super-saver order first, then total cost would be \$15.38.

## A Real-Life Example

| Location | Inventory | Cost: Order 1 <br> 03/20 00:01 PDT | Cost: Order 2 <br> 03/20 00:13 PDT |
| :---: | :---: | :---: | :---: |
| Warehouse 1 | 1 | 2.42 | 2.57 |
| Warehouse 2 | $>1$ | 2.56 | 3.87 |

## A Real-Life Example

| Location | Inventory | Cost: Order 1 <br> 03/20 00:01 PDT | Cost: Order 2 <br> 03/20 00:13 PDT |
| :---: | :---: | :---: | :---: |
| Warehouse 1 | 1 | 2.42 | 2.57 |
| Warehouse 2 | $>1$ | 2.56 | 3.87 |

## A Subtle Modification

| Location | Inventory | Cost: Order 1 <br> 03/20 00:01 PDT | Cost: Order 2 <br> 03/20 00:13 PDT |
| :---: | :---: | :---: | :---: |
| Warehouse 1 | 1 | 2.42 | 2.57 |
| Warehouse 2 | $>1$ | 2.42 | 3.87 |

## Possible Solutions

- Have more inventory, or place it better.
- Constantly worked on at Amazon
- More inventory has a cost in itself
- We can never always have perfect inventory placement

## Possible Solutions

- Have more inventory, or place it better.
- Constantly worked on at Amazon
- More inventory has a cost in itself
- We can never always have perfect inventory placement
- Fulfill multiple orders at the same time
- Generally infeasible
- Potential customer experience impact - how long do we wait?

## Possible Solutions

- Have more inventory, or place it better.
- Constantly worked on at Amazon
- More inventory has a cost in itself
- We can never always have perfect inventory placement
- Fulfill multiple orders at the same time
- Generally infeasible
- Potential customer experience impact - how long do we wait?
- Opportunity cost
- How to define?
- Necessary inputs may be highly volatile or of dubious value

## Note on Opportunity Cost

- Our order planning engine plans greedily, and hence sub-optimally.
- By having additional costs added to the solver, we can influence its decision:

| FC | Fulfillment Cost | Opportunity Cost | Total Cost |
| :---: | :---: | :---: | :---: |
| RNO1 | $\$ 3.50$ | $\$ 1.50$ | $\$ 5.00$ |
| LEX1 | $\$ 4.00$ | $\$ 0.50$ | $\$ 4.50$ |

- Opportunity cost calculates the amount we'd be willing to pay extra.

## Note on Opportunity Cost

- Opportunity cost is a cost we will pay now for an expectation of savings in the future.
- Why pay more? A letter costs 46 cents to send, regardless of origin/destination.
- Would it suffice to only deal with tied situations?

| Country | \% of Units Involved In Tied Fulfillment Plans |  |
| :---: | :---: | :---: |
|  | Real-life | Optimally |
| DE | $16.04 \%$ | $36.91 \%$ |

## The Demand Model

## Demand materializes sequentially, with the probability of demand coming from region $i$ at any step being $p_{i}, \sum p_{i}=1$.

| Region 1, Region 1 | 0.64 | 0.64 | Region 1: 2 units <br> Region 2: 0 units |
| :---: | :---: | :---: | :---: |
| Region 1, Region 2 | 0.16 | 0.32 | Region 1: 1 unit <br> Region 2: 1 unit |
| Region 2, Region 1 | 0.16 | 0.04 | Region 1: 0 units <br> Region 2: 2 units |
| Region 2, Region 2 | 0.04 | 0.04 |  |

## A Note on Optimality

Finding the optimal solution for known demand and a given inventory level is not easy:

$$
\begin{aligned}
& \operatorname{opt}\left(\left\{d_{1}, d_{2}, \ldots\right\} \mid \mathcal{J}\right) \\
& \quad=\min _{F C i}\left(c_{d_{1}, i}+\operatorname{opt}\left(\left\{d_{2}, \ldots\right\} \mid \mathcal{J}-e_{i}\right)\right)
\end{aligned}
$$

Additionally, in a lot of cases it's not practical.

## Simple Example (no ties)

## Situation:

| Order Type | Probability | Cost: <br> Warehouse 1 | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: |
| Standard | $50 \%$ | 1 | 2 |
| Express | $50 \%$ | 3 | 5 |

10,000 simulations of 20 orders, starting with inventory

|  | Warehouse 1 | Warehouse 2 |
| :---: | :---: | :---: |
| Inventory | 15 | 5 |

## Simple Example (no ties)

- On average, optimal saves \$5 over greedy.

## Typical Workaround

If we are dealing with orders greedily, then we will choose the warehouse that minimizes the following:
opportunity cost, or cost-to-go

$$
c_{d, i}+f(\square)
$$

where ■ can be a variety of things: inventory levels, past demand, forecasted demand, future expected inbound arrivals, ...

## Core Principle

- If we encounter an order that has tied fulfillment plans, we want to choose the option that has the lowest future expected cost.
- How do we calculate lowest future expected cost?

## Single-SKU Demand Model

- Regions $R_{1}, R_{2}, \ldots, R_{n}$
- Demand probabilities $p_{1}, \ldots, p_{n}$ with $\sum p_{i}=1$
- Warehouses $W_{1}, W_{2}, \ldots, W_{m}$
- Cost matrix showing the cost of fulfilling demand from $W_{i}$ to region $R_{j}$

| Order Type | Probability | Cost: <br> Warehouse 1 | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: |
| Super Saver | $50 \%$ | 1 | 2 |
| Express | $50 \%$ | 3 | 5 |

## Simplest Recursion

- Two warehouses, two regions

| Region | Probability | Cost: <br> Warehouse 1 | Cost: <br> Warehouse 2 |  |
| :---: | :---: | :---: | :---: | :---: |
| $R_{1}$ | $p_{1}$ | $c_{11}$ | $<$ | $c_{12}$ |
| $R_{2}$ | $p_{2}$ | $c_{21}$ | $>$ | $c_{22}$ |

$\operatorname{cost}(0, b)=p_{1} c_{12} b+p_{2} c_{22} b$
$\operatorname{cost}(a, 0)=p_{1} c_{11} a+p_{2} c_{21} a$
$\operatorname{cost}(a, b)=$

$$
p_{1}\left(c_{11}+\operatorname{cost}(a-1, b)\right)
$$

$$
+\quad p_{2}\left(c_{22}+\operatorname{cost}(a, b-1)\right)
$$

## What About Ties?

| Region | Probability | Cost: <br> Warehouse 1 |  | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: | :---: |
| $R_{1}$ | $p_{1}$ | $c_{11}$ | $<$ | $c_{12}$ |
| $R_{2}$ | $p_{2}$ | $c_{21}$ | $>$ | $c_{22}$ |
| $R_{3}$ | $p_{3}$ | $c_{31}$ | $=$ | $c_{32}$ |

$$
\begin{array}{ccc}
\operatorname{cost}(a, b)=+ & p_{1}\left(c_{11}+\operatorname{cost}(a-1, b)\right) \\
p_{2}\left(c_{22}+\operatorname{cost}(a, b-1)\right) \\
+ & p_{3}\left(c_{31}+?\right)
\end{array}
$$

## What About Ties?

| Region | Probability | Cost: <br> Warehouse 1 |  | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: | :---: |
| $R_{1}$ | $p_{1}$ | $c_{11}$ | $<$ | $c_{12}$ |
| $R_{2}$ | $p_{2}$ | $c_{21}$ | $>$ | $c_{22}$ |
| $R_{3}$ | $p_{3}$ | $c_{31}$ | $=$ | $c_{32}$ |

$\operatorname{cost}(a, b)$

$$
=\begin{gathered}
\\
+ \\
p_{1}\left(c_{11}+\operatorname{cost}(a-1, b)\right) \\
+\quad p_{2}\left(c_{22}+\operatorname{cost}(a, b-1)\right) \\
c_{31}+\min \binom{\operatorname{cost}(a-1, b)}{\operatorname{cost}(a, b-1)}
\end{gathered}
$$

## What About 3 Warehouses?

| $W_{1}<W_{2}<W_{3}$ | $W_{1}=W_{2}<W_{3}$ |  |  |
| :---: | :--- | :---: | :---: |
| $W_{1}<W_{3}<W_{2}$ | $W_{3}<W_{1}=W_{2}$ |  |  |
| $W_{2}<W_{1}<W_{3}$ | $W_{1}=W_{3}<W_{2}$ |  |  |
| $W_{2}<W_{3}<W_{1}$ | $W_{2}<W_{1}=W_{3}$ |  |  |
| $W_{3}<W_{1}<W_{2}$ | $W_{2}=W_{3}<W_{1}$ |  |  |
| $W_{3}<W_{2}<W_{1}$ | $W_{1}<W_{2}<W_{3}$ |  |  |
|  |  |  |  |

## What About 4 Warehouses?

- 75 different possibilities!
- With 50 warehouses, there are $1,995,015,910,118,319,790,635,433,747,742,913,123,711,612,309,013,079,035,980,385,090,523,556,363$ possibilities ${ }^{\dagger}$ !
- In practice, Amazon.com observed ~250K different scenarios in its NA network.

## Common Topologies

## Common Topologies

## In Practice

| Region | Probability | Cost: <br> Warehouse 1 | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: |
| $R_{1}$ | $40 \%$ | 1 | 2 |
| $R_{2}$ | $40 \%$ | 3 | 1 |
| $R_{3}$ | $20 \%$ | 2 | 2 |
|  |  | $\downarrow$ |  |
| $R_{1}$ | $40 \%$ | 0 | 1 |
| $R_{2}$ | $40 \%$ | 2 | 0 |
| $R_{3}$ | $20 \%$ | 0 | 0 |

## In Practice

| Region | Probability | Cost: <br> Warehouse 1 | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: |
| $R_{1}$ | $40 \%$ | 0 | 1 |
| $\boldsymbol{R}_{\mathbf{2}}$ | $\mathbf{2 0} \%$ | $\mathbf{1}$ | $\mathbf{0}$ |
| $\boldsymbol{R}_{\mathbf{3}}$ | $\mathbf{2 0} \%$ | $\mathbf{3}$ | $\mathbf{0}$ |
| $R_{4}$ | $20 \%$ | 0 | 0 |
|  |  | $\downarrow$ |  |
| $R_{1}$ | $40 \%$ | 0 | 1 |
| $\boldsymbol{R}_{\mathbf{2}}$ | $\mathbf{4 0} \%$ | $\mathbf{2}$ | $\mathbf{0}$ |
| $R_{3}$ | $20 \%$ | 0 | 0 |

| Region | Probability | Cost: <br> Warehouse 1 | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: |
| $R_{1}$ | $40 \%$ | 0 | 1 |
| $R_{2}$ | $40 \%$ | 2 | 0 |
| $R_{3}$ | $20 \%$ | 0 | 0 |

| 20 | 8.00 | 7.40 | 6.80 | 6.20 | 5.61 | 5.02 | 46 | 3.92 | 3.42 | 2.97 | 2.58 | 2.25 | 1.99 | 1.79 | 1.65 | 1.56 | 1.51 | 1.48 | 1.48 | 1.49 | 51 |

## What Does It Mean?

## - We don't want to be left with inventory only in Warehouse 1.

| 20 | 8.00 | 7.40 | 6.80 | 6.20 | 5.62 | 5.05 | 4.50 | 4.01 | 3.57 | 3.20 | 2.92 | 2.71 | 2.57 | 2.50 | 2.47 | 2.48 | 2.52 | 2.60 | 2.74 | 2.96 | 3.26 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Simple Example (with ties)

| Order Type | Probability | Cost: <br> Warehouse 1 | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: |
| Super Saver | $40 \%$ | 1 | 2 |
| Express | $40 \%$ | 3 | 5 |
| Standard | $20 \%$ | 3 | 3 |
|  | Initial inventory: (15,5) |  |  |

## Simple Example (with ties)

| Scenario | Optimal | Tie-breaking | Greedy |
| :---: | :---: | :---: | :---: |
| Average Fulfillment Cost | 45.29 | 47.26 | 49.97 |

## Simple Example (with ties)

| Order Type | Probability | Cost: <br> Warehouse 1 | Cost: <br> Warehouse 2 |
| :---: | :---: | :---: | :---: |
| Super Saver | $\frac{100-x}{2} \%$ | 1 | 2 |
| Express | $\frac{100-x}{2} \%$ | 3 | 5 |
| Standard | $x \%$ | 3 | 3 |
|  | Initial Inventory: (15,5) |  |  |

Tie-Breaking Proportion over Varying Proportions of Tied Orders

Optimality Gap over Varying Proportions of Tied Orders (relative)

## Results

- Via Amazon's supply chain simulator:
- DE: covered 22\% of optimality gap
- JP: covered 60\% of optimality gap
- $75 \%$ of savings via split-shipment reduction
- Results validated via controlled experiment in production.

## Future Steps

- Model modifications
- Primary addition: pending arrival of purchase orders
- Initial experiments indicated very little improvement even with perfect knowledge of PO arrivals
- Back-door to opportunity cost
- Applications to other areas of supply chain
