Conclusions 000

Lecture IV: Option pricing in energy markets

Fred Espen Benth

Centre of Mathematics for Applications (CMA) University of Oslo, Norway

Fields Institute, 19-23 August, 2013

Spread options

Asian options 0000000000 Quanto options

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Conclusions 000

Introduction

- OTC market huge for energy derivatives
- Highly exotic products:
 - Asian options on power spot
 - Various (cross-commodity) spread options
 - Demand/volume triggered derivatives
 - Swing options
- Payoff depending on spot, indices and/or forwards/futures
- In this lecture: Pricing and hedging of (some) of these exotics

Spread options

Asian options

Quanto options

Conclusions 000

Example of swing options

• Simple operation of a gas-fired power plant: income is

$$\int_t^\tau e^{-r(s-t)} u(s) \left(P(s) - G(s) \right) \, ds$$

- P and G power and gas price resp, in Euro/MWh.
 - Heating rate is included in G...
- $0 \le u(s) \le 1$ production rate in MWh
 - Decided by the operator
- Value of power plant

$$V(t) = \sup_{0 \le u \le 1} \mathbb{E}\left[\int_t^\tau e^{-r(s-t)} u(s) \left(P(s) - G(s)\right) ds \,|\, \mathcal{F}_t\right]$$

- More fun if there are constraints on production volume....
 - Maximal and/or minimal total production
 - Flexible load contracts, user-time contracts

- Tolling agreement: virtual power plant contract
 - Strip of European call on spread between power spot and fuel
 - Fuel being gas or coal

$$V(t) = \int_t^\tau e^{-r(s-t)} \mathbb{E}\left[\max\left(P(s) - G(s), 0\right) \mid \mathcal{F}_t\right] ds$$

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

- Spark spread, the value of exchanging gas with power
 - Dark spread, crack spread, clean spread....

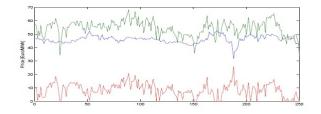

Spread options

Asian options 0000000000 Quanto options

(日) (同) (日) (日)

Conclusions 000

German (EEX) spark spread in 2011

- Green: EEX power (Euro/MWh)
- Blue: Natural gas (Euro/MWH)
- Red: Spark spread, with efficiency factor (heat rate) of 49.13%

Spread options

Asian options

Quanto options

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Conclusions 000

Example: Asian options

European call option on the average power spot price

$$\max\left(\frac{1}{\tau_2-\tau_1}\int_{\tau_1}^{\tau_2} S(u)\,du-K,0\right)$$

- Traded at NordPool around 2000
 - "Delivery period" a given month
 - Options traded until τ_1 , beginning of "delivery"

Spread options

Asian options

Quanto options

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Conclusions 000

Example: Energy quanto options

- Extending Asian options to include volume trigger
- Sample payoff

$$\max\left(\frac{1}{\tau_2-\tau_1}\int_{\tau_1}^{\tau_2} S(u) \, du - K_P, 0\right)$$
$$\times \max\left(\frac{1}{\tau_2-\tau_1}\int_{\tau_1}^{\tau_2} T(u) \, du - K_T, 0\right)$$

- T(u) is the temperature at time u
 - in a location of interest, or average over some area (country)
- Energy quantos on:
 - gas and temperature (demand)
 - or power and wind (supply)
 - Dependency between energy price and temperature crucial

- Our concern: valuation for exponential non-Gaussian stationary processes
 - Exponential Lévy semistationary (LSS) models

Spread options	Asian o
000000000	00000

Quanto options

Conclusions 000

• Recall definition of LSS process from Lecture III

$$Y(t) = \int_{-\infty}^{t} g(t-s)\sigma(s) \, dL(s)$$

- L a (two-sided) Lévy process (with finite variance)
- σ a stochastic volatility process
- g kernel function defined on \mathbb{R}_+
- Integration in semimartingale (Ito) sense
 - $g(t \cdots) \times \sigma(\cdot)$ square-integrable
- Y is stationary whenever σ is
 - Prime example: $g(x) = \exp(-\alpha x)$, Ornstein-Uhlenbeck process

Introduction 000000	Spread options	Asian options	Quanto options 0000000	Conclusions 000

• Bivariate spot price dynamics

 $\ln P(t) = \Lambda_P(t) + Y_P(t)$ $\ln G(t) = \Lambda_G(t) + Y_G(t)$

- Λ_i(t) seasonality function, Y_i(t) LSS process with kernel g_i and stochastic volatility σ_i, i = P, G
 - The stochastic volatilites are assumed *independent* of U_P, U_G

- $L = (U_P, U_G)$ bivariate (square integrable) Lévy process
 - Denote cumulant (log-characteristic function) by $\psi(x, y)$.
- We suppose that spot model is under Q
 - Pricing measure

Spread options

Asian options

Quanto options

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Conclusions 000

Fourier approach to pricing

- To compute the expected value under Q for the spread:
- Factorize out the gas component

$$\Lambda_{P}(\tau)\mathbb{E}\left[e^{Y_{G}(\tau)}\left(e^{Y_{P}(\tau)-Y_{G}(\tau)}-h\frac{\Lambda_{G}(\tau)}{\Lambda_{P}(\tau)}\right)^{+}\mid\mathcal{F}_{t}\right]$$

- Apply the tower property of conditional expectation, conditioning on σ_i ,
 - Recall being independent of L

•
$$\mathcal{G}_t = \mathcal{F}_t \vee \{\sigma_i(\cdot), i = P, G\}$$

 $\Lambda_P(\tau) \mathbb{E} \left[\mathbb{E} \left[e^{Y_G(\tau)} \left(e^{Y_P(\tau) - Y_G(\tau)} - h \frac{\Lambda_G(\tau)}{\Lambda_P(\tau)} \right)^+ | \mathcal{G}_t \right] | \mathcal{F}_t \right]$

Introduction	Spread options	Asian options	Quanto options	Conclusions
000000		000000000	0000000	000

• For inner expectation, use that Z is the density of an Esscher transform for $t \leq \tau$

 $Z(t) = \mathrm{e}^{\int_{-\infty}^{t} g_G(\tau-s)\sigma_G(s) \, dU_G(s) - \int_{-\infty}^{t} \psi_G(-\mathrm{i}g_G(\tau-s)\sigma_G(s)) \, ds}$

(日) (同) (三) (三) (三) (○) (○)

- $\psi_G(y) = \psi(0, y)$, the cumulant of U_G .
- The characteristics of L is known under this transform
- This "removes" the multiplicative term $\exp(Y_G(\tau))$ from inner expectation
- Finally, apply Fourier method

Introduction	Spread options	Asian options	Quanto options	Conclusions
000000	0000000000	000000000	000000	000

• Define , for c > 1,

$$f_c(x) = e^{-cx} \left(e^x - h \frac{\Lambda_G}{\Lambda_P} \right)^+$$

- $f_c \in L^1(\mathbb{R})$, and its Fourier transform $\widehat{f}_c \in L^1(\mathbb{R})$
- Representation of f_c:

$$f_c(x) = \frac{1}{2\pi} \int_{\mathbb{R}} \widehat{f}_c(y) \mathrm{e}^{\mathrm{i} x y} \, dy$$

• Gives general representation for a random variable X

$$\mathbb{E}[f(X)] = \frac{1}{2\pi} \int \widehat{f}_c(y) \mathbb{E}\left[e^{i(y-ic)X}\right] dy$$

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Conclusions

Theorem

Suppose exponential integrability of L. Then the spread option has the price at t $\leq \tau$

$$C(t,\tau) = e^{-r(\tau-t)} \frac{\Lambda_P(\tau)}{2\pi} \int_{\mathbb{R}} \widehat{f}_c(y) \Phi_c\Big(Y_P(t,\tau), Y_G(t,\tau)\Big) \Psi_{c,t,\tau}(y) \, dy$$

where, for i = P, G,

$$Y_i(t,\tau) = \int_{-\infty}^t g_i(\tau-s)\sigma_i(s) \, dU_i(s)$$

$$\Phi_c(u,v) = \exp\left((y-\mathrm{i}c)u + (1-(\mathrm{i}y+c))v\right)$$

and

$$\Psi_{c,t,\tau}(y) = \mathbb{E}\left[e^{\int_t^\tau \psi((y-ic)g_P(\tau-s)\sigma_P,((c-1)i-y)g_G(\tau-s)\sigma_G(s))\,ds} \,|\,\mathcal{F}_t\right]$$

- Note: spread price not a function of the current power and gas spot, but on Y_i(t, τ), i = P, G
- Recalling theory from Lecture III: $Y_i(t, \tau)$ is given by the logarithmic forward price....

$$\ln f_i(t,\tau) = X_i(t,\tau,\sigma_i(t)) + Y_i(t,\tau)$$

• No stochastic volatility, $\sigma_i = 1$: X_i is a deterministic function

Conclusions 000

Some remarks on hedging

- Power spot not tradeable, gas requires storage facilities
- Alternatively, hedge spread option using forwards!
- But incomplete model, so only partial hedging possible
 - Quadratic hedging, for example
 - May also depend on stochastic volatility, making model "more incomplete"
- In real markets: forwards on power and gas deliver over a given time period
 - Further complication, as we cannot easily express spread in such forwards
 - Further approximation of partial hedging strategy

Conclusions 000

Asian options

Asian options

- Options on the average spot price over a period
 - Traded at NordPool up to around 2000 for "monthly periods"
- Recall payoff function

$$\max\left(\frac{1}{\tau_2-\tau_1}\int_{\tau_1}^{\tau_2} S(u)\,du-K,0\right)$$

• Geometric LSS spot model:

$$\ln S(t) = \Lambda(t) + Y(t)$$

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

• Y an LSS process with kernel g and stochastic volatility σ

Introduction	Spread options	Asian options	Quanto options	Conclusions
000000	0000000000	000000000	0000000	000

- Pricing requires simulation
 - Propose an efficient Monte Carlo simulation of the path of an LSS process
- Suppose that $g_{\lambda}(u) := \exp(\lambda u)g(u) \in L^1(\mathbb{R})$ and its Fourier transform is in $L^1(\mathbb{R})$

$$Y(t) = rac{1}{2\pi} \int_{\mathbb{R}} \widehat{g}_{\lambda}(y) \widehat{Y}_{\lambda,y}(t) \, dy$$

• $\widehat{Y}_{\lambda,y}(t)$ complex-valued Ornstein-Uhlenbeck process

$$\widehat{Y}_{\lambda,y}(t) = \int_{-\infty}^{t} \mathrm{e}^{(\mathrm{i}y-\lambda)(t-s)} \sigma(s) \, dL(s)$$

- ロ ト - 4 回 ト - 4 □ - 4

ntroduction	Spread options	Asian options	Quanto options	Conclusions
00000	000000000	000000000	000000	000

 Paths of Ornstein-Uhlenbeck processes can be simulated iteratively

$$\widehat{Y}_{\lambda,y}(t+\delta) = e^{(iy-\lambda)\delta} \widehat{Y}_{\lambda,y}(t) + e^{(iy-\lambda)\delta} \int_{t}^{t+\delta} e^{(iy-\lambda)(t-s)\sigma(s)} dL(s)$$

- Numerical integration (fast Fourier) to obtain paths of Y
 - Extend g to \mathbb{R} if g(0) > 0
 - Let g(u) = 0 for u < 0 if g(0) = 0.
 - Smooth out g at u = 0 if singular in origo
- Error estimates in $L^2\text{-norm}$ of the paths in terms of time-stepping size δ

Spread options

Asian options

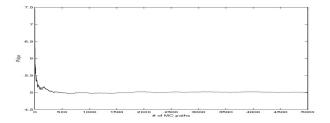

Quanto options

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Conclusions 000

- Asian call option on Y over [0, 1], with strike K = 5
- Y BSS-process, with $\sigma = 1$, Y(0) = 10, and kernel (modified Bjerksund model)

$$g(u) = \frac{1}{u+1} \exp(-u)$$

Spread options

Asian options

Quanto options

Conclusions 000

Issues of hedging

 Let F(t, τ₁, τ₂) be forward price for contract delivering power spot S over τ₁ to τ₂: At t = τ₂,

$$F(\tau_2,\tau_1,\tau_2) = \frac{1}{\tau_2 - \tau_1} \int_{\tau_1}^{\tau_2} S(u) \, du$$

- Asian option: call option on forward with exercise time au_2
- In power and gas, forwards are traded with delivery period
 - Hence, can price, but also hedge using these
 - Analyse based on forward price model rather than spot!
- Problem: many contracts are *not* traded in the settlement period
 - Can hedge up to time au_1
 - ...but not all the way up to exercise τ_2

Example: quadratic hedging

- Hedge option with payoff X at exercise au_2 , using $\psi(s)$ forwards
- Assume Levy (jump) dynamics for the forward price
 - Martingale dynamics
- Can only trade forward up to time $au_1 < au_2$

$$egin{aligned} V(t) &= V(0) + \int_{0}^{t \wedge au_{1}} \psi(s) dF(s) \ &+ \mathbf{1}_{\{t > au_{1}\}} \psi(au_{1}) (F(t, au_{1}, au_{2}) - F(au_{1}, au_{1}, au_{2})) \end{aligned}$$

• Predictable strategies ψ being integrable with respect to F.

• Minimize quadratic hedging error

 $\mathbb{E}[(X - V(\tau_2))^2]$

• Solution:

- Classical quadratic hedge up to time τ_1 ,
- thereafter, use the constant hedge

$$\psi_{\min} = \frac{\mathbb{E}[X(F(\tau_2) - F(\tau_1)) \mid \mathcal{F}_{\tau_1}]}{\mathbb{E}[(F(\tau_2) - F(\tau_1))^2 \mid \mathcal{F}_{\tau_1}]}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Spread options

Asian options

Quanto options

Conclusions 000

Example: geometric Brownian motion

- X call option with strike K at time τ_2
- $t \mapsto F(t, \tau_1, \tau_2)$ geometric Brownian motion with constant volatility σ
 - We suppose the forward is tradeable only up to time $au_1 < au_2$
- Quadratic hedge
 - N is the cumulative standard normal distribution function

$$\psi(t) = \left\{ egin{array}{cc} \mathsf{N}(d(t)), & t \leq T_1 \ \psi_{\min}, & t > T_1 \end{array}
ight.$$

where

$$\psi_{\min} = \frac{F(\tau_1)e^{\sigma^2(\tau_2 - \tau_1)}N(\sigma\sqrt{\tau_2 - \tau_1} + d(\tau_1)) - (K + F(\tau_1))N(d(\tau_1)) + KN(d(\tau_1) - \sigma\sqrt{\tau_2 - \tau_1})}{F(\tau_1)(e^{\sigma^2(\tau_2 - \tau_1)} - 1)}$$

$$d(t) = \frac{\ln(F(t, \tau_1, \tau_2)/K) + 0.5\sigma^2(\tau_2 - t)}{\sigma\sqrt{\tau_2 - t}}$$

Conclusions 000

Quanto options

opread options

Asian options

Quanto options

Conclusions 000

• Recall payoff of an energy quanto option

$$\max\left(\frac{1}{\tau_2 - \tau_1}\int_{\tau_1}^{\tau_2} S(u) \, du - K_P, 0\right) \\ \times \max\left(\mathsf{T}_{\mathsf{index}}(\tau_1, \tau_2) - K_T, 0\right)$$

- $T_{index}(\tau_1, \tau_2)$ temperature index measured over $[\tau_1, \tau_2]$
 - CAT index, say, or HDD/CDD
- Consider idea of viewing the contract as an option on two forwards
 - Product of two calls,
 - One on forward energy, and one on temperature (CAT forward)
- Main advantages
 - Avoid specification of the risk premium in the spot modelling
 - Can price "analytically" rather than via simulation

Spread options

Asian options

Quanto options

Conclusions 000

Case study: bivariate GBM

Consider bivariate GBM model

 $dF_{P}(t,\tau_{1},\tau_{2}) = \sigma_{P}(t,\tau_{1},\tau_{2})F_{P}(t,\tau_{1},\tau_{2}) dW_{P}(t)$ $dF_{T}(t,\tau_{1},\tau_{2}) = \sigma_{T}(t,\tau_{1},\tau_{2})F_{T}(t,\tau_{1},\tau_{2}) dW_{T}(t)$

- σ_P, σ_T deterministic volatilities, W_P, W_T correlated Brownian motions
- May express the price of the quanto as a "Black-76-like" formula

Spread options

Asian options

Quanto options

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

Conclusions 000

• Price of quanto at time $t \leq \tau_1$ is

$$C(t) = e^{-r(\tau_2 - t)} \{F_P(t)F_T(t)e^{\rho\sigma_P\sigma_T}N(d_P^{***}, d_T^{***}) \\ -F_P(t)K_TN(d_P^{**}, d_T^{**}) - F_T(t)K_PN(d_P^{*}, d_T^{*}) \\ +K_PK_TN(d_P, d_T)\}$$

where

$$\begin{aligned} d_i &= \frac{\ln(F_i(t)/K) - 0.5\sigma_i^2}{\sigma_i}, \quad d_i^{**} = d_i + \sigma_i, i = P, T\\ d_i^* &= d_i + \rho\sigma_j, \quad d_i^{***} = d_i + \rho\sigma_j + \sigma_i, i, j = P, T, i \neq j \end{aligned}$$

- N(x, y) bivariate cumulative distribution function with correlation ρ, equal to the one between W_P, and W_T
- σ_P and σ_T integrated volatility

$$\sigma_i^2 = \int_t^{\tau_2} \sigma_i^2(s, \tau_1, \tau_2) \, ds \,, \quad i = P, T$$

Spread options
