Massive C^* -algebras, Winter 2021, I. Farah, Lecture 8

We are continuing the proof of (a version of) Keisler's theorem: all ultrapowers of a fixed separable C*-algebra associated with nonprincipal ultrafilters on \mathbb{N} are isomorphic, assuming: (CH) Every set of cardinality \mathfrak{c} has a well-ordering such that every proper initial segment is countable (i.e., a well-ordering of *type* \aleph_1). Recall:

Lemma If C is a C*-algebra of density character \aleph_1 , then $C = \bigcup_{\alpha < \aleph_1} C_{\alpha}$ for a continuous \aleph_1 -chain of separable elementary submodels C_{α} , for $\alpha < \aleph_1$.

(*Continuous* means that $C_{\beta} = \lim_{\alpha < \beta} C_{\alpha}$ for every limit ordinal β .)

Lemma Suppose that A and B have density character \aleph_1 and Φ is an isomorphism from A onto B. Then A and B can be represented as increasing unions of countable chains of separable elementary substructures, $A = \bigcup_{\alpha} A_{\alpha}$, $B = \bigcup_{\alpha} B_{\alpha}$, so that $\Phi[A_{\alpha}] = B_{\alpha}$ for all α . A correction to the statement made last time (thanks to Ben for pointing this out):

Fact

There are unital, separable, AF algebras A and B such that $A \equiv B$ and $A \ncong B$, but no explicit example of a pair of such simple algebras is known.

There is a family of \aleph_1 abelian examples (Eagle–Vignati): $C(\alpha + 1)$, for α a countable indecomposable ordinal.

$$\mathcal{A} = \mathcal{B} + \mathcal{Y} \qquad \frac{\mathcal{W} + \mathcal{W}}{\mathcal{W}^2}$$

$$= \mathcal{I} \mathcal{A} = \mathcal{I} \quad \mathcal{O}_{\mathcal{I}} \mathcal{A} = \mathcal{I} \quad \mathcal{W}^2$$

Thm (Corollary 16.6.5, Keisler) Suppose that C and D are countably saturated, elementarily equivalent, and of density character \aleph_1 . Then $C \cong D$.

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のQ@

Thm (Corollary 16.6.5, Keisler) Suppose that C and D are countably saturated, elementarily equivalent, and of density character \aleph_1 . Then $C \cong D$.

Proof: Write $C = \bigcup_{\alpha < \aleph_1} C_{\alpha}$ and $D = \bigcup_{\alpha < \aleph_1} D_{\alpha}$, continuous chains of elementary submodels.

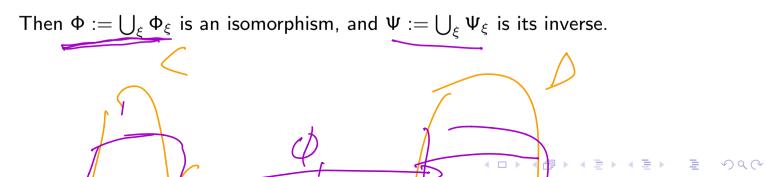

se fordula

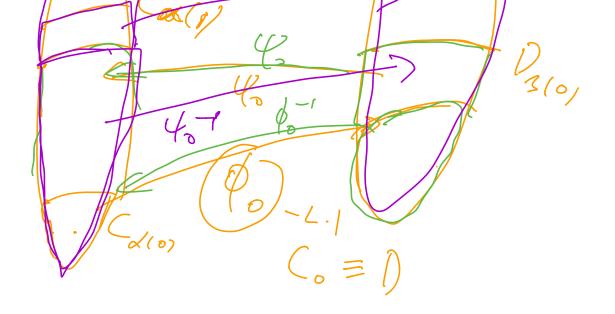

Thm (Corollary 16.6.5, Keisler) Suppose that C and D are countably saturated, elementarily equivalent, and of density character \aleph_1 . Then $C \cong D$.

Proof: Write $C = \bigcup_{\alpha < \aleph_1} C_{\alpha}$ and $D = \bigcup_{\alpha < \aleph_1} D_{\alpha}$, continuous chains of elementary submodels. We will find continuous increasing families $\alpha(\xi)$, $\beta(\xi)$, $\xi < \aleph_1$, and elementary embeddings $\Phi_{\xi} : C_{\alpha(\xi)} \to D$ and $\Psi_{\xi} : D_{\beta(\xi)} \to C$ such that for all $\xi < \eta$

1.
$$\Phi_{\xi}[C_{\alpha(\xi)}] \subseteq D_{\beta(\xi)}$$
. $\Psi_{\xi}[D_{\beta(\xi)}] \subseteq C_{\alpha(\xi+1)}$.

- 2. $\Psi_{\xi} \circ \Phi_{\xi}(a) = a$, for $a \in C_{\alpha(\xi)}$, $\Phi_{\xi+1} \circ \Psi_{\xi}(b) = b$, for $b \in D_{\alpha(\xi)}$,
- 3. Φ_{η} extends Φ_{ξ} , Ψ_{η} extends Ψ_{ξ} .

The proof gives a more precise statement:

Thm (Corollary 16.6.5) Suppose that C and D are countably saturated, elementarily equivalent, and of density character \aleph_1 . Then $C \cong D$, and the isomorphism can be chosen so that it extends any fixed isomorphism $\Phi_0: C_0 \to D_0$ between separable elementary submodels of C and D.

If the Continuum Hypothesis (CH) holds, A is a separable C^* -algebra, and \mathcal{U} and \mathcal{V} are nonprincipal ultrafilters on \mathbb{N} , then there is an isomorphism $\Phi: A_{\mathcal{U}} \to A_{\mathcal{V}}$ that commutes with the diagonal embedding of A.

ALA $|_{A \prec A_{U^{-}}}$ AUNA' - AUNA'

¹All ultrafilters are nonprincipal and over \mathbb{N} .

If the Continuum Hypothesis (CH) holds, A is a separable C^* -algebra, and \mathcal{U} and \mathcal{V} are nonprincipal ultrafilters on \mathbb{N} , then there is an isomorphism $\Phi: A_{\mathcal{U}} \to A_{\mathcal{V}}$ that commutes with the diagonal embedding of A.

Corollary $\chi(A) \leq \sqrt{1}$

If A is a <u>separable</u> C^* -algebra, then CH implies that all ultrapowers of A maps are isomorphic, and all relative commutants of A in its ultrapowers are isomorphic.¹

¹All ultrafilters are nonprincipal and over \mathbb{N} .

If the Continuum Hypothesis (CH) holds, A is a separable C^* -algebra, and \mathcal{U} and \mathcal{V} are nonprincipal ultrafilters on \mathbb{N} , then there is an isomorphism $\Phi: A_{\mathcal{U}} \to A_{\mathcal{V}}$ that commutes with the diagonal embedding of A.

Corollary

If A is a separable C^* -algebra, then CH implies that all ultrapowers of A on \mathbb{N} are isomorphic, and all relative commutants of A in its ultrapowers are isomorphic.¹

Corollary

There are nonisomorphic separable, simple, AF algebras with isomorphic ultrapowers.

¹All ultrafilters are nonprincipal and over \mathbb{N} .

If the Continuum Hypothesis (CH) holds, A is a separable C^* -algebra, and \mathcal{U} and \mathcal{V} are nonprincipal ultrafilters on \mathbb{N} , then there is an isomorphism $\Phi: A_{\mathcal{U}} \to A_{\mathcal{V}}$ that commutes with the diagonal embedding of A.

Corollary

If A is a separable C^* -algebra, then CH implies that all ultrapowers of A on \mathbb{N} are isomorphic, and all relative commutants of A in its ultrapowers are isomorphic.¹

Corollary

There are nonisomorphic separable, simple, AF algebras with isomorphic ultrapowers. Prop (Kirchberg) $A \equiv B$ does not imply $A_{\mathcal{U}} \cap A' \equiv B_{\mathcal{U}} \cap B'$, even for separable, simple, A and B.

¹All ultrafilters are nonprincipal and over \mathbb{N} .

That answers $\frac{1}{2}$ of Kirchberg's question. Now for McDuff.

▲□▶▲圖▶▲≧▶▲≧▶ ≧ めへぐ

That answers $\frac{1}{2}$ of Kirchberg's question. Now for McDuff. Recall that R (the hyperfinite II₁ factor) is the operator algebra such that for all $n \ge 1$, the *n*-ball of R is the completion of the *n*-ball of $M_{2^{\infty}}$ in the 2-norm associated with the unique tracial state, $||a||_2 := \tau (a^*a)^{1/2}$.

That answers $\frac{1}{2}$ of Kirchberg's question. Now for McDuff. Recall that R (the hyperfinite II₁ factor) is the operator algebra such that for all $n \ge 1$, the *n*-ball of R is the completion of the *n*-ball of $M_{2^{\infty}}$ in the 2-norm associated with the unique tracial state, $||a||_2 := \tau (a^*a)^{1/2}$. The tracial ultrapower is

$$\mathbb{R}^{\mathcal{U}} := \frac{\ell_{\infty}(R)}{(a_n)} \lim_{n \to \mathcal{U}} \|a_n\|_2 = 0 \}.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ♪ ♪

That answers $\frac{1}{2}$ of Kirchberg's question. Now for McDuff. Recall that R (the hyperfinite II₁ factor) is the operator algebra such that for all $n \ge 1$, the *n*-ball of R is the completion of the *n*-ball of $M_{2^{\infty}}$ in the 2-norm associated with the unique tracial state, $||a||_2 := \tau (a^*a)^{1/2}$. The tracial ultrapower is

$$R^{\mathcal{U}} := \ell_{\infty}(R) / \{(a_n) | \lim_{n \to \mathcal{U}} ||a_n||_2 = 0\}.$$

Thus $R^{\mathcal{U}} \cong (M_{2^{\infty}})^{\mathcal{U}}$ and $R^{\mathcal{U}} \cap R' \cong (M_{2^{\infty}})^{\mathcal{U}} \cap (M_{2^{\infty}})'.$
Corollary
If \mathcal{U} and \mathcal{V} are nonprincipal ultrafilters on \mathbb{N} , then $R^{\mathcal{U}} \cong R^{\mathcal{V}}$ and $R^{\mathcal{U}} \cap R' \cong R^{\mathcal{V}} \cap R'$

That answers $\frac{1}{2}$ of Kirchberg's question. Now for McDuff. Recall that R (the hyperfinite II₁ factor) is the operator algebra such that for all $n \ge 1$, the *n*-ball of R is the completion of the *n*-ball of $M_{2^{\infty}}$ in the 2-norm associated with the unique tracial state, $||a||_2 := \tau (a^*a)^{1/2}$. Thm 16.5.1 B_{∞} is countably saturated for every B.

The asymptotic sequence algebra

(a few theorems with proofs omitted; see $\S16.3$, $\S16.5$) $c_0(B) := \{(a_n) \in \ell_\infty(B) | \lim_n \|a_n\| = 0\}.$ The algebra $B_{\infty} := \ell_{\infty}(B)/c_0(B)$ is the asymptotic sequence algebra.

Łoś's Theorem generally fails for the diagonal embedding of B into B_{∞} .

Thm 16.3.1 (Ghasemi) It is possible to compute $Th(B_{\infty})$ from Th(B). Th (BOXCCHI)

Thm 16.5.1 B_{∞} is countably saturated for every B.

Thm (F., 2020) For any separable B we have

- 1. $B \cong B \otimes C(K)$ (K denotes the Cantor space).
- 2. Any 'diagonal' copy of $B\otimes C(K)$ in B_∞ is an elementary submodel.
- 3. CH implies that $\underline{B}_{\infty} \cong (B \otimes C(\mathcal{M}))_{\mathcal{U}}$, for any nonprincipal ultrafilter \mathcal{U} on \mathbb{N} . くしん 「「」(山)(山)(山)(山)

Another theorem with its proof omitted

Thm (F.–Hart–Rørdam–Tikuisis, 2017) CH implies that³

$$(\underline{M_{2^{\infty}}})_{\mathcal{U}}\cap (\underline{M_{2^{\infty}}})'\cong (\underline{M_{2^{\infty}}})_{\mathcal{U}}.$$

(One can replace $M_{2^{\infty}}$ with any strongly self-absorbing C^{*}-algebra, or with R with respect to a tracial ultrapower.)

 $\{X \subseteq \alpha | \text{ the order type of } X \text{ is } < \alpha \}.$

6. $\mathcal{Z}_0 := \{X \subseteq \mathbb{N} | \limsup_n |X \cap n| / n = 0\}$

Given a family of C*-algebras B_j , for $j \in J$, and an ideal \mathcal{J} on J, we let $\bigoplus_{\mathcal{J}} B_j := \{ \overline{b} \in \prod_{j \in J} B_j : \limsup_{j \to \mathcal{J}} \|b_j\| = 0 \}$

Def 16.2.1 The reduced product of an indexed family B_j , for $j \in \mathbb{J}$, of C*-algebras associated with an ideal \mathcal{J} on \mathbb{J} is the quotient $\prod_j B_j / \bigoplus_{\mathcal{J}} B_j$. We will sometimes denote it $\prod_j B_j / \mathcal{J}$. Ghasemi's Feferman–Vaught Theorem still holds, but countable saturation may fail. (There is no known characterization of ideals for which every associated reduced product is countably saturated.)
