Grothendieck's Theorem (1952) asserts that countably compact subspaces of certain function spaces are actually compact. He also connected that topological condition to exchanging double limits.

Many applications in functional analysis, recent applications in model theory (undefinability of pathological Banach spaces), and more recent applications (lovino) to machine learning.

Background	Arhangel'skiĭ	lovino	Conclusion	Grothendieck	PFA C-Tight & Grothendieck

●	00000	0000000	0000	000000	

Many applications in functional analysis, recent applications in model theory (undefinability of pathological Banach spaces), and more recent applications (lovino) to machine learning.

Arhangel'skiĭ showed that the conclusion of Grothendieck's Theorem held for a large class of spaces he called *Grothendieck spaces*.

We showed that the boundaries of that class are set-theoretically indeterminate, answering several of Arhangel'skii's questions.

With Clovis Hamel, we used Arhangel'skii's work to greatly generalize the results of Jose Iovino and his collaborators on the undefinability in compact logics of pathological Banach spaces (related to a problem of W. T. Gowers).

Background	Arhangel'skiĭ	lovino	Conclusion	Grothendieck	PFA C-Tight & Grothendieck
●	00000	0000000	0000	000000	

Arhangel'skiĭ showed that the conclusion of Grothendieck's Theorem held for a large class of spaces he called *Grothendieck spaces*.

We showed that the boundaries of that class are set-theoretically indeterminate, answering several of Arhangel'skii's questions.

With Clovis Hamel, we used Arhangel'skii's work to greatly generalize the results of Jose Iovino and his collaborators on the undefinability in compact logics of pathological Banach spaces (related to a problem of W. T. Gowers).

More recently, Hamel and I have shown that these results hold for a much larger class of logics, highlighting the importance of conditions that assert the exchangeability of certain double limits. See our arXiv preprint: *On the undefinability of pathological Banach spaces.* 

Arhangel'skiĭ ●0000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

#### Definition

Let X be a topological space. We will assume X is completely regular unless specified otherwise. Then  $C_p(X)$  is the collection of real-valued continuous functions on X, given the topology of pointwise convergence, which means the topology  $C_p(X)$  inherits from  $\mathbb{R}^X$ .

Arhangel'skiĭ ●0000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

# $C_p$ -Theory

#### Definition

Let X be a topological space. We will assume X is completely regular unless specified otherwise. Then  $C_p(X)$  is the collection of real-valued continuous functions on X, given the topology of pointwise convergence, which means the topology  $C_p(X)$  inherits from  $\mathbb{R}^X$ .

## Theorem (Arhangel'skiĭ-Pytkeev)

All finite powers of X are Lindelöf if and only if  $C_p(X)$  is countably tight.

#### Corollary

If X is compact,  $C_p(X)$  is countably tight.

Arhangel'skiĭ 0●000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

# Grothendieck Spaces

### Definition

#### A subspace Y of X is

countably compact in X if every infinite subset of Y has a limit point in X. We equivalently say Y is relatively countably compact.

relatively compact if  $\overline{Y}$  is compact.

A space X is a g-space if relatively countably compact  $\implies$  relatively compact.

Arhangel'skiĭ 0●000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

# Grothendieck Spaces

## Definition

A subspace Y of X is

countably compact in X if every infinite subset of Y has a limit point in X. We equivalently say Y is relatively countably compact.

relatively compact if  $\overline{Y}$  is compact.

A space X is a *g*-space if relatively countably compact  $\implies$  relatively compact.

### Definition

A space X is weakly Grothendieck if  $C_p(X)$  is a g-space. A space X is Grothendieck if  $C_p(X)$  is a hereditary g-space. (A hereditary g-space is also called angelic.)

# Some of Arhangel'skii's work:

#### Definition

A space X is Fréchet-Urysohn iff for every subset  $A \subseteq X$ , every point  $a \in \overline{A}$  is the limit of a sequence of points in A.

# Some of Arhangel'skii's work:

#### Definition

A space X is Fréchet-Urysohn iff for every subset  $A \subseteq X$ , every point  $a \in \overline{A}$  is the limit of a sequence of points in A.

#### Theorem

A g-space is a hereditary g-space iff every compact subspace of it is Fréchet-Urysohn.

# Some of Arhangel'skii's work:

#### Definition

A space X is Fréchet-Urysohn iff for every subset  $A \subseteq X$ , every point  $a \in \overline{A}$  is the limit of a sequence of points in A.

#### Theorem

A g-space is a hereditary g-space iff every compact subspace of it is Fréchet-Urysohn.

#### Theorem

The Grothendieck property is preserved by dense subspaces and continuous images.

Background	Arhangel'skiĭ	Conclusion	Grothendieck	PFA C-Tight & Grothendieck

We proved (I)  $\iff$  (IV) for X countably tight, i.e., countably tight spaces satisfy the double ultralimit condition.

We trivially have (I)  $\iff$  (II) if X is weakly Grothendieck.

Arhangel'skiĭ 00000	lovino ooooooo	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

An immediate consequence of the ultralimit definitions:

#### Lemma

If X is weakly Grothendieck and satisfies the double ultralimit condition, then for every  $A \subseteq C_p(X, [0, 1])$  we have  $\text{DULC}(A, X) \implies A$  is relatively compact.

Arhangel'skiĭ 00000	lovino 00000●0	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck 000000000000

An immediate consequence of the ultralimit definitions:

#### Lemma

If X is weakly Grothendieck and satisfies the double ultralimit condition, then for every  $A \subseteq C_p(X, [0, 1])$  we have  $\text{DULC}(A, X) \implies A$  is relatively compact.

The  $\implies$  can be strengthened to  $\iff$  for countably tight spaces.

#### Theorem

Let X be countably tight. Then  $A \subseteq C_p(X, [0, 1])$  is relatively compact  $\iff \text{DULC}(A, X)$ .

### Some of our work

Hamel and I used Arhangel'skii's work on Grothendieck spaces to generalize lovino et al's work far beyond compactness.

# Some of our work

Hamel and I used Arhangel'skiï's work on Grothendieck spaces to generalize lovino et al's work far beyond compactness.

Recently, building also on the work of functional analysts H. König and N. Kuhn, we have further explored exchangeability of double ultralimits and shown that the undefinability results hold for logics satisfying the common generalization "weakly Grothendieck plus the double ultralimit condition" of compactness and countable tightness.

# Some of our work

Hamel and I used Arhangel'skii's work on Grothendieck spaces to generalize lovino et al's work far beyond compactness.

Recently, building also on the work of functional analysts H. König and N. Kuhn, we have further explored exchangeability of double ultralimits and shown that the undefinability results hold for logics satisfying the common generalization "weakly Grothendieck plus the double ultralimit condition" of compactness and countable tightness.

This greatly improves the undefinability results in our paper  $C_p$ -theory for model theorists, which appeared in lovino's book Beyond First-order Model Theory, II. This new paper, On the undefinability of pathological Banach spaces, is available on arXiv and will hopefully enable us to generalize the results of lovino et al on Deep Learning.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion ●000	Grothendieck 000000	PFA C-Tight & Grothendieck

### Conclusion

In the many applications of double limit exchange, much weaker assumptions than compactness suffice. In particular, the following classes of spaces are all weakly Grothendieck and satisfy the double ultralimit condition: countably compact spaces, countably tight spaces, *k*-spaces, separable spaces. This observation enables us to extend lovino et al's undefinability results from compact logics to countably compact logics, which they claimed in their first preprint but later withdrew.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0●00	Grothendieck 000000	PFA C-Tight & Grothendieck

It is remarkable that there is a useful common generalization of compactness and countable tightness.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0●00	Grothendieck 000000	PFA C-Tight & Grothendieck

It is remarkable that there is a useful common generalization of compactness and countable tightness.

That compactness implies the Grothendieck property and the double-limit condition has been known since the 1950's, but the fact that countably tightness implies weak Grothendieck was only proved by Arhangel'skiĩ in the 1990's and that it implies the double ultralimit condition (and that that combination is useful) was only proved last spring.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion ○●○○	Grothendieck 000000	PFA C-Tight & Grothendieck

It is remarkable that there is a useful common generalization of compactness and countable tightness.

PFA C-Tight & Grothendieck

Countable Tightness and the Grothendieck Property in  $C_p$ Theory

Grothendieck

000000

The Grothendieck property has become important in research on the definability of pathological Banach spaces [CI18], [HT20], [HT22].

The proof of Grothendieck's Theorem involves interchanging double limits as one often does in Analysis, e.g. under suitable conditions,

$$\lim_{m\to\infty}\lim_{n\to\infty}f_n(x_m)=\lim_{n\to\infty}\lim_{m\to\infty}f_n(x_m).$$

PFA C-Tight & Grothendieck

Countable Tightness and the Grothendieck Property in  $C_p$ Theory

Grothendieck

The Grothendieck property has become important in research on the definability of pathological Banach spaces [CI18], [HT20], [HT22].

The proof of Grothendieck's Theorem involves interchanging double limits as one often does in Analysis, e.g. under suitable conditions,

$$\lim_{m\to\infty}\lim_{n\to\infty}f_n(x_m)=\lim_{n\to\infty}\lim_{m\to\infty}f_n(x_m).$$

Jose lovino noticed a connection between interchanging double limits and definability in model theory.

PFA C-Tight & Grothendieck

# Countable Tightness and the Grothendieck Property in $C_{\rho}$ Theory

The Grothendieck property has become important in research on the definability of pathological Banach spaces [CI18], [HT20], [HT22].

The proof of Grothendieck's Theorem involves interchanging double limits as one often does in Analysis, e.g. under suitable conditions,

$$\lim_{m\to\infty}\lim_{n\to\infty}f_n(x_m)=\lim_{n\to\infty}\lim_{m\to\infty}f_n(x_m).$$

Jose lovino noticed a connection between interchanging double limits and definability in model theory. He and P. Casazza used this to prove the undefinability in first order (continuous) logic of a famous pathological Banach space: Tsirelson's space.

# Countable Tightness and the Grothendieck Property in $C_{\rho}$ Theory

The Grothendieck property has become important in research on the definability of pathological Banach spaces [CI18], [HT20], [HT22].

The proof of Grothendieck's Theorem involves interchanging double limits as one often does in Analysis, e.g. under suitable conditions,

$$\lim_{m\to\infty}\lim_{n\to\infty}f_n(x_m)=\lim_{n\to\infty}\lim_{m\to\infty}f_n(x_m).$$

Jose lovino noticed a connection between interchanging double limits and definability in model theory. He and P. Casazza used this to prove the undefinability in first order (continuous) logic of a famous pathological Banach space: Tsirelson's space. I saw that their results could be greatly generalized using  $C_p$ -theory, but today I'm just talking about topology rather than model theory.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck ○○○○○●	PFA C-Tight & Grothendieck

We here answer a question of Arhangel'skiĭ by proving it undecidable whether countably tight spaces with Lindelöf finite powers are Grothendieck.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 00000●	PFA C-Tight & Grothendieck

We here answer a question of Arhangel'skiĭ by proving it undecidable whether countably tight spaces with Lindelöf finite powers are Grothendieck.

We answer another of his questions by proving that PFA implies Lindelöf countably tight spaces are Grothendieck.

## Strengthening Arhangel'skii's Result

In [Arh98], Arhangel'skiĭ proved:

#### Proposition 2

 $MA + \neg CH$  implies that if X is countably tight and X<sup>n</sup> is Lindelöf for all  $n < \omega$ , then X is Grothendieck.

## Strengthening Arhangel'skii's Result

In [Arh98], Arhangel'skiĭ proved:

Proposition 2

 $MA + \neg CH$  implies that if X is countably tight and X<sup>n</sup> is Lindelöf for all  $n < \omega$ , then X is Grothendieck.

In fact,  $MA_{\omega_1}$  suffices.

# Strengthening Arhangel'skii's Result

In [Arh98], Arhangel'skiĭ proved:

Proposition 2

 $MA + \neg CH$  implies that if X is countably tight and  $X^n$  is Lindelöf for all  $n < \omega$ , then X is Grothendieck.

In fact,  $MA_{\omega_1}$  suffices.

Arhangel'skiĭ asked whether the conclusion of the Proposition is true in ZFC.

# Strengthening Arhangel'skii's Result

#### Proposition 2

 $MA + \neg CH$  implies that if X is countably tight and X<sup>n</sup> is Lindelöf for all  $n < \omega$ , then X is Grothendieck.

Arhangel'skiĭ asked whether the conclusion of the Proposition is true in ZFC.

It is not:

# Strengthening Arhangel'skii's Result

#### Proposition 2

 $MA + \neg CH$  implies that if X is countably tight and  $X^n$  is Lindelöf for all  $n < \omega$ , then X is Grothendieck.

Arhangel'skiĭ asked whether the conclusion of the Proposition is true in ZFC.

#### Example

Assuming  $\diamondsuit$  plus Kurepa's Hypothesis, Ivanov [Iva78] constructed a compact space Y of cardinality 2<sup>c</sup> such that Y<sup>n</sup> is hereditarily separable for all  $n < \omega$ .  $C_p(Y)$  is the required counterexample.

To see this, we require several results from the literature.

## Arhangel'skiï's Result and ZFC

### Lemma ([Arh92])

 $X^n$  is Lindelöf for every  $n < \omega$  if and only if  $C_p(X)$  is countably tight.

## Arhangel'skii's Result and ZFC

### Lemma ([Arh92])

 $X^n$  is Lindelöf for every  $n < \omega$  if and only if  $C_p(X)$  is countably tight.

### Definition

A space X is Fréchet-Urysohn if whenever x is a limit point of  $Z \subseteq X$ , there is a sequence in Z converging to x.

# Arhangel'skii's Result and ZFC

## Lemma ([Arh92])

 $X^n$  is Lindelöf for every  $n < \omega$  if and only if  $C_p(X)$  is countably tight.

## Lemma ([Arh98])

X is Grothendieck if and only if it is weakly Grothendieck and compact subspaces of  $C_p(X)$  are Fréchet-Urysohn.

He also proved:

Lemma ([Arh92])

X embeds into  $C_p(C_p(X))$ .

# Arhangel'skiĭ's Result and ZFC

Lemma ([Arh92])

 $X^n$  is Lindelöf for every  $n < \omega$  if and only if  $C_p(X)$  is countably tight.

## Lemma ([Arh98])

X is Grothendieck if and only if it is weakly Grothendieck and compact subspaces of  $C_p(X)$  are Fréchet-Urysohn.

### Lemma ([Arh92])

X embeds into  $C_p(C_p(X))$ .

Clearly, separable Fréchet-Urysohn spaces have cardinality  $\leq c$ . Ivanov's space Y is too big to be Fréchet-Urysohn, yet it embeds in  $C_p(C_p(Y))$ , so  $C_p(Y)$  cannot be Grothendieck, although it is weakly Grothendieck.

## Arhangel'skiï's Result and ZFC

Clearly, separable Fréchet-Urysohn spaces have cardinality  $\leq c$ . Ivanov's space Y is too big to be Fréchet-Urysohn, yet it embeds in  $C_p(C_p(Y))$ , so  $C_p(Y)$  cannot be Grothendieck, although it is weakly Grothendieck.

 $(C_p(Y))^n$  is, however, (hereditarily) Lindelöf for all  $n < \omega$  by the Velichko-Zenor theorem:

## Arhangel'skii's Result and ZFC

Clearly, separable Fréchet-Urysohn spaces have cardinality  $\leq c$ . Ivanov's space Y is too big to be Fréchet-Urysohn, yet it embeds in  $C_p(C_p(Y))$ , so  $C_p(Y)$  cannot be Grothendieck, although it is weakly Grothendieck.

 $(C_p(Y))^n$  is, however, (hereditarily) Lindelöf for all  $n < \omega$  by the Velichko-Zenor theorem:

## Lemma ([Vel81], [Zen80])

If  $X^n$  is hereditarily separable for all  $n < \omega$ , then  $(C_p(X))^n$  is hereditarily Lindelöf for all  $n < \omega$ .

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

Finally,  $C_p(Y)$  is countably tight since Y is compact, so  $C_p(Y)$  is Lindelöf, countably tight, but not Grothendieck.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

Finally,  $C_p(Y)$  is countably tight since Y is compact, so  $C_p(Y)$  is Lindelöf, countably tight, but not Grothendieck.

A dramatic strengthening of the conclusion of Arhangel'skii's Proposition is

#### Theorem

PFA implies Lindelöf countably tight spaces are Grothendieck.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

Finally,  $C_p(Y)$  is countably tight since Y is compact, so  $C_p(Y)$  is Lindelöf, countably tight, but not Grothendieck.

A dramatic strengthening of the conclusion of Arhangel'skii's Proposition is

#### Theorem

PFA implies Lindelöf countably tight spaces are Grothendieck.

The proof actually follows easily from known results.
Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

A space is surlindelöf if it is a subspace of  $C_p(X)$  for some Lindelöf X.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

A space is surlindelöf if it is a subspace of  $C_p(X)$  for some Lindelöf X.

## Arhangel'skiĭ proved:

Lemma ([Arh92])

PFA implies that every surlindelöf compact space is countably tight.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

A space is surlindelöf if it is a subspace of  $C_p(X)$  for some Lindelöf X.

# Lemma ([Arh92])

PFA implies that every surlindelöf compact space is countably tight.

Okunev and Reznichenko proved:

# Lemma ([OR07])

 $MA_{\omega_1}$  implies that every separable surlindelöf compact countably tight space is metrizable.

# The Proof: Fréchet-Urysohn

### Theorem

PFA implies that every surlindelöf compact space is *Fréchet-Urysohn*.

# The Proof: Fréchet-Urysohn

#### Theorem

PFA implies that every surlindelöf compact space is *Fréchet-Urysohn*.

*Proof*. Metrizable spaces are clearly Fréchet-Urysohn. By countable tightness, if K is compact and  $L \subseteq K$  and  $p \in \overline{L}$ , then there is a countable  $M \subseteq L$  such that  $p \in \overline{M}$ . But  $\overline{M}$  is separable compact and so metrizable.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

## This proves the Theorem.

## Theorem

PFA implies Lindelöf countably tight spaces are Grothendieck.

This proves the Theorem.

Theorem

PFA implies Lindelöf countably tight spaces are Grothendieck.

In fact, as often happens, we have:

#### Theorem

If ZFC is consistent, so is ZFC plus "every Lindelöf countably tight space is Grothendieck".

A space is realcompact if it can be embedded as a closed subspace in a product of copies of the real line.

#### Lemma

A closed subspace of a realcompact space is realcompact.

#### Lemma

A completely regular space is compact if and only if it is realcompact and countably compact.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

A space is realcompact if it can be embedded as a closed subspace in a product of copies of the real line.

#### Lemma

A closed subspace of a realcompact space is realcompact.

#### Lemma

A completely regular space is compact if and only if it is realcompact and countably compact.

#### Lemma

If X is countably tight, then  $C_p(X)$  is realcompact.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

A space is *wD* if whenever  $\{d_n : n < \omega\}$  is closed discrete, there is an infinite  $S \subseteq \omega$  and a discrete collection of open sets  $\{U_n : n \in S\}$  with  $d_n \in U_n$  for all  $n \in S$ .

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

A space is wD if whenever  $\{d_n : n < \omega\}$  is closed discrete, there is an infinite  $S \subseteq \omega$  and a discrete collection of open sets  $\{U_n : n \in S\}$  with  $d_n \in U_n$  for all  $n \in S$ .

#### Lemma

Every realcompact space is wD.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

### Lemma

Let X be wD. Let Y be countably compact in X. Then  $\overline{Y}$  is countably compact.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

#### Lemma

Let X be wD. Let Y be countably compact in X. Then  $\overline{Y}$  is countably compact.

*Proof.* Suppose not. Let  $\{d_n : n < \omega\}$  be a closed discrete subspace of  $\overline{Y}$ . Let  $\{U_n : n < \omega\}$  be a discrete collection of open subsets of X, with  $d_n \in U_n$  for every  $n \in S$ , where  $S \subseteq \omega$  is infinite. Pick  $e_n \in U_n \cap Y$ . Then  $\{e_n : n \in S\}$  is a closed discrete subspace of Y, contradiction.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

## Theorem

Countably tight spaces are weakly Grothendieck.

Arhangel'skiĭ 00000	lovino 0000000	Conclusion 0000	Grothendieck 000000	PFA C-Tight & Grothendieck

#### Theorem

Countably tight spaces are weakly Grothendieck.

*Proof.* Let X be countably tight. Then  $C_p(X)$  is realcompact and hence wD. Let Y be countably compact in  $C_p(X)$ , then  $\overline{Y}$  is countably compact. But  $\overline{Y}$  is realcompact so  $\overline{Y}$  is compact.
